

Meeting of the Sagebrush Ecosystem Council

December 11, 2015

Agenda Item 10

State Management Category Map Update and Approval

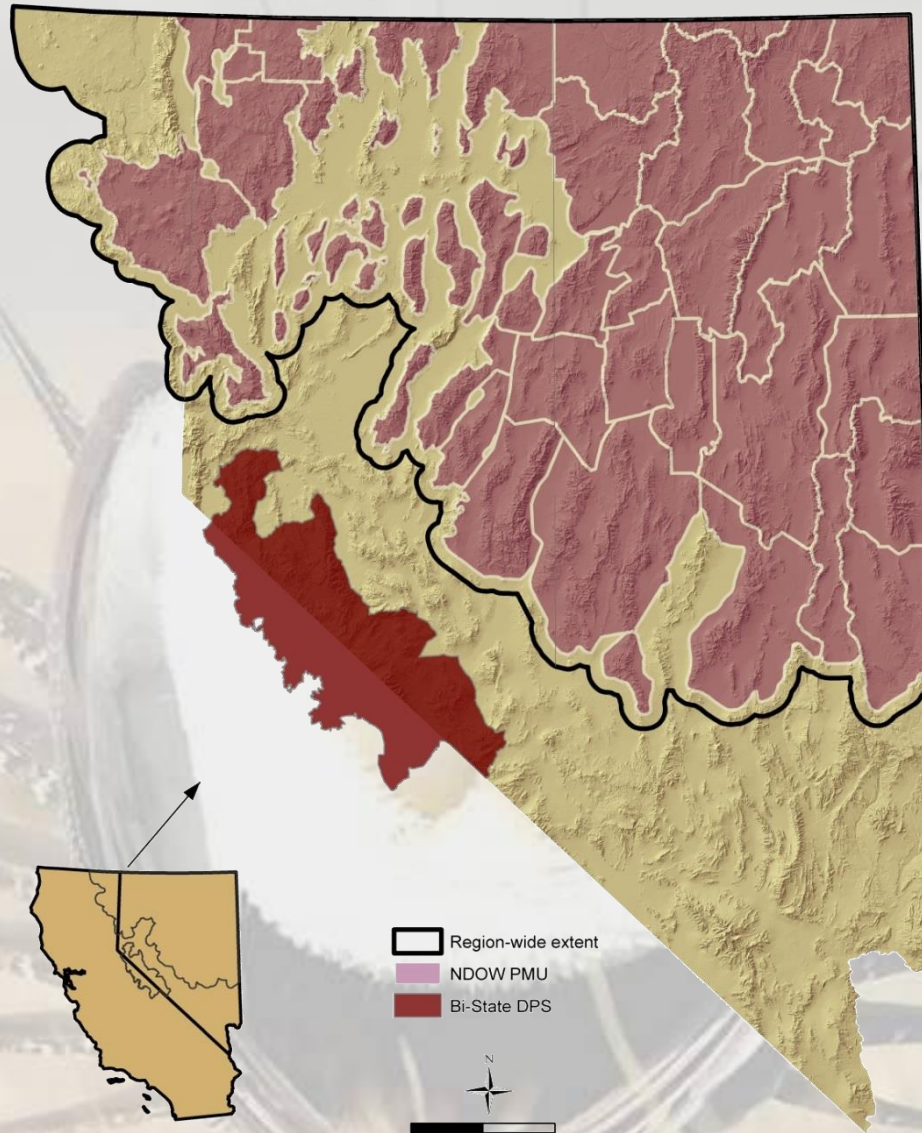

Peter S. Coates, USGS

Presentation Topics

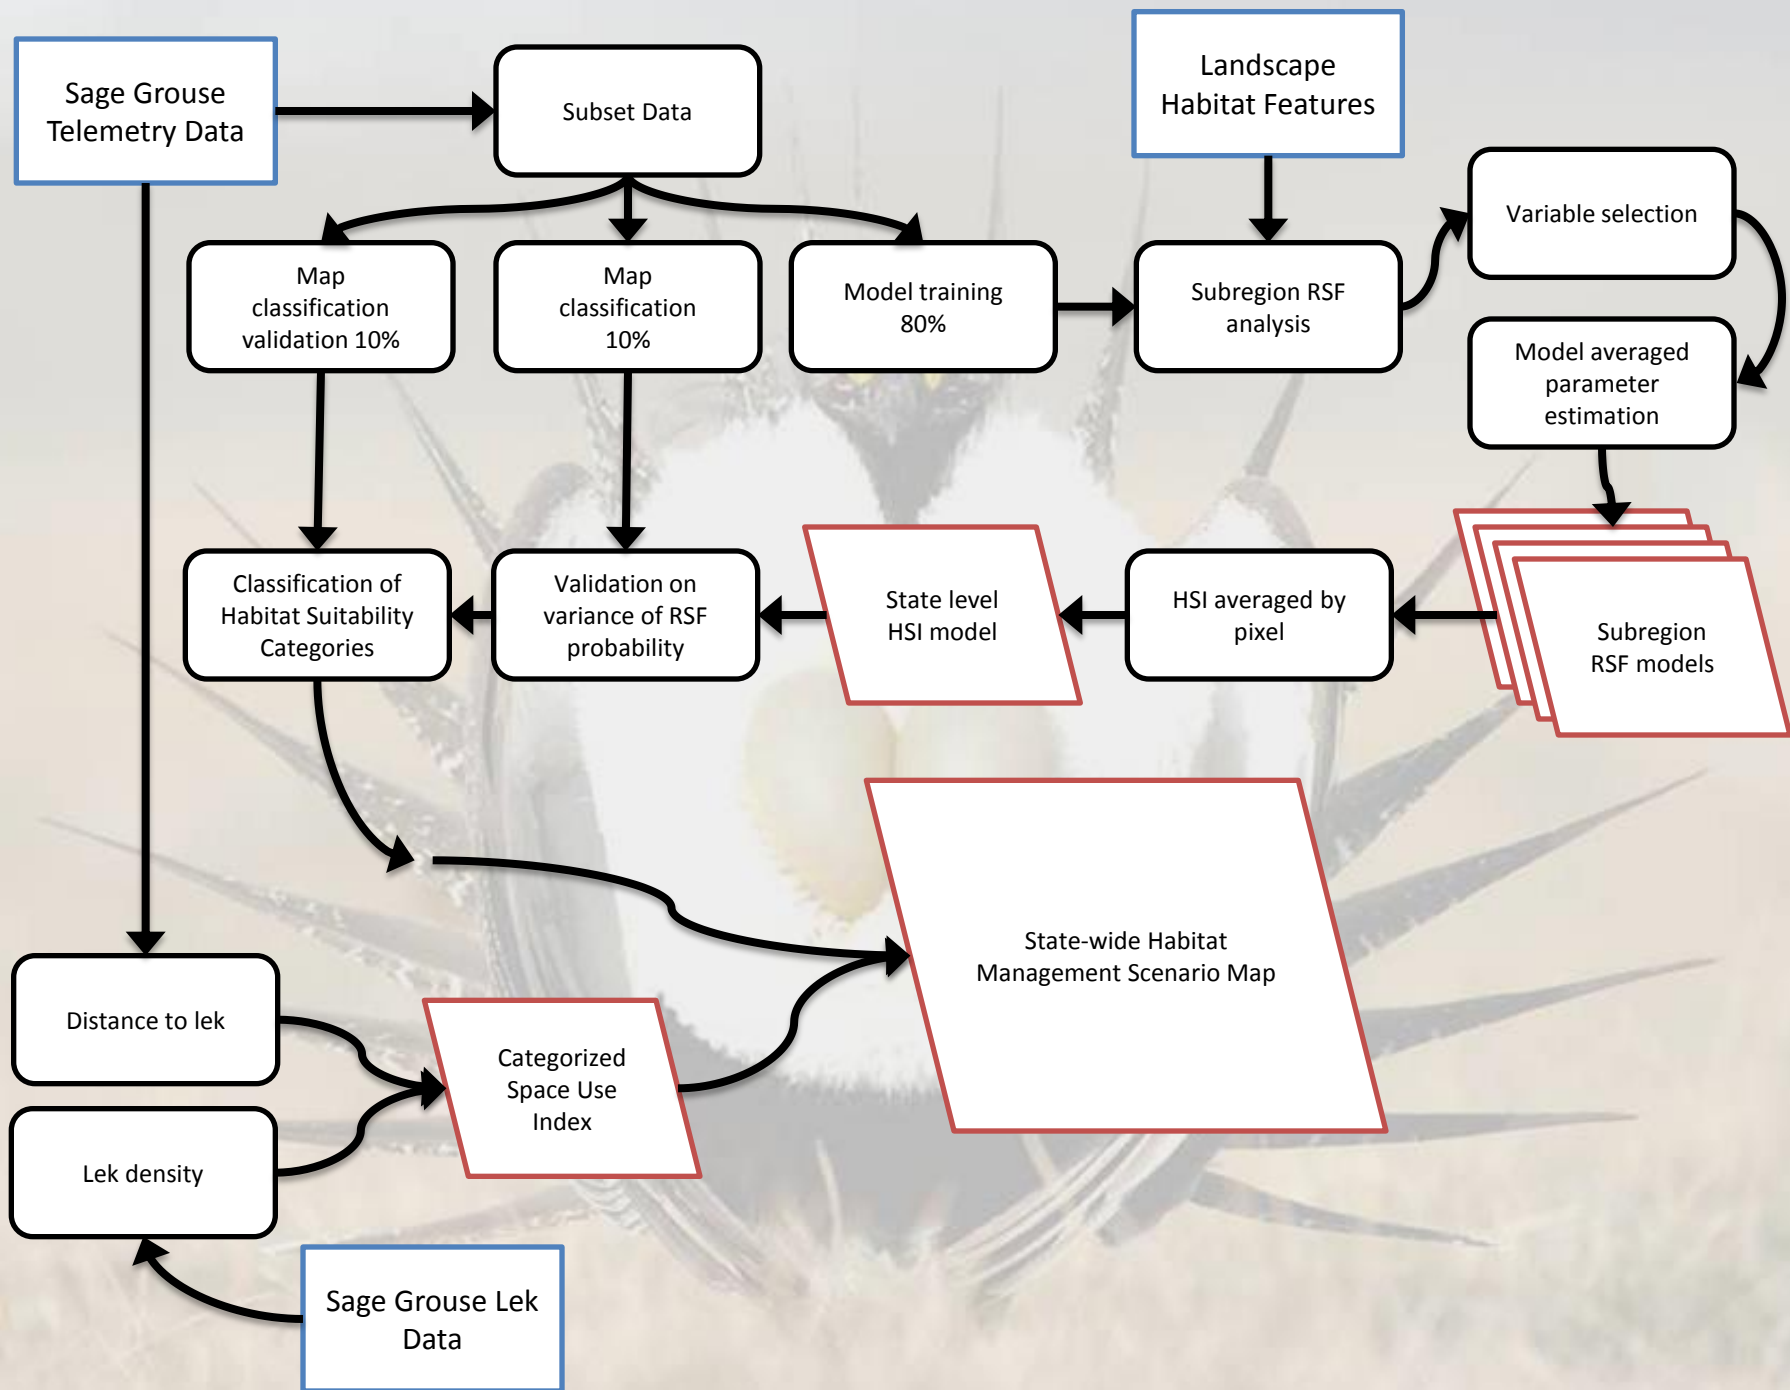

- 
- 1) Habitat Model Process (Improvements)**
 - 2) Updated Habitat Selection Models (Annual and Seasonal)**
 - 3) Space Use and Abundance Model**
 - 4) Habitat Management Categories**

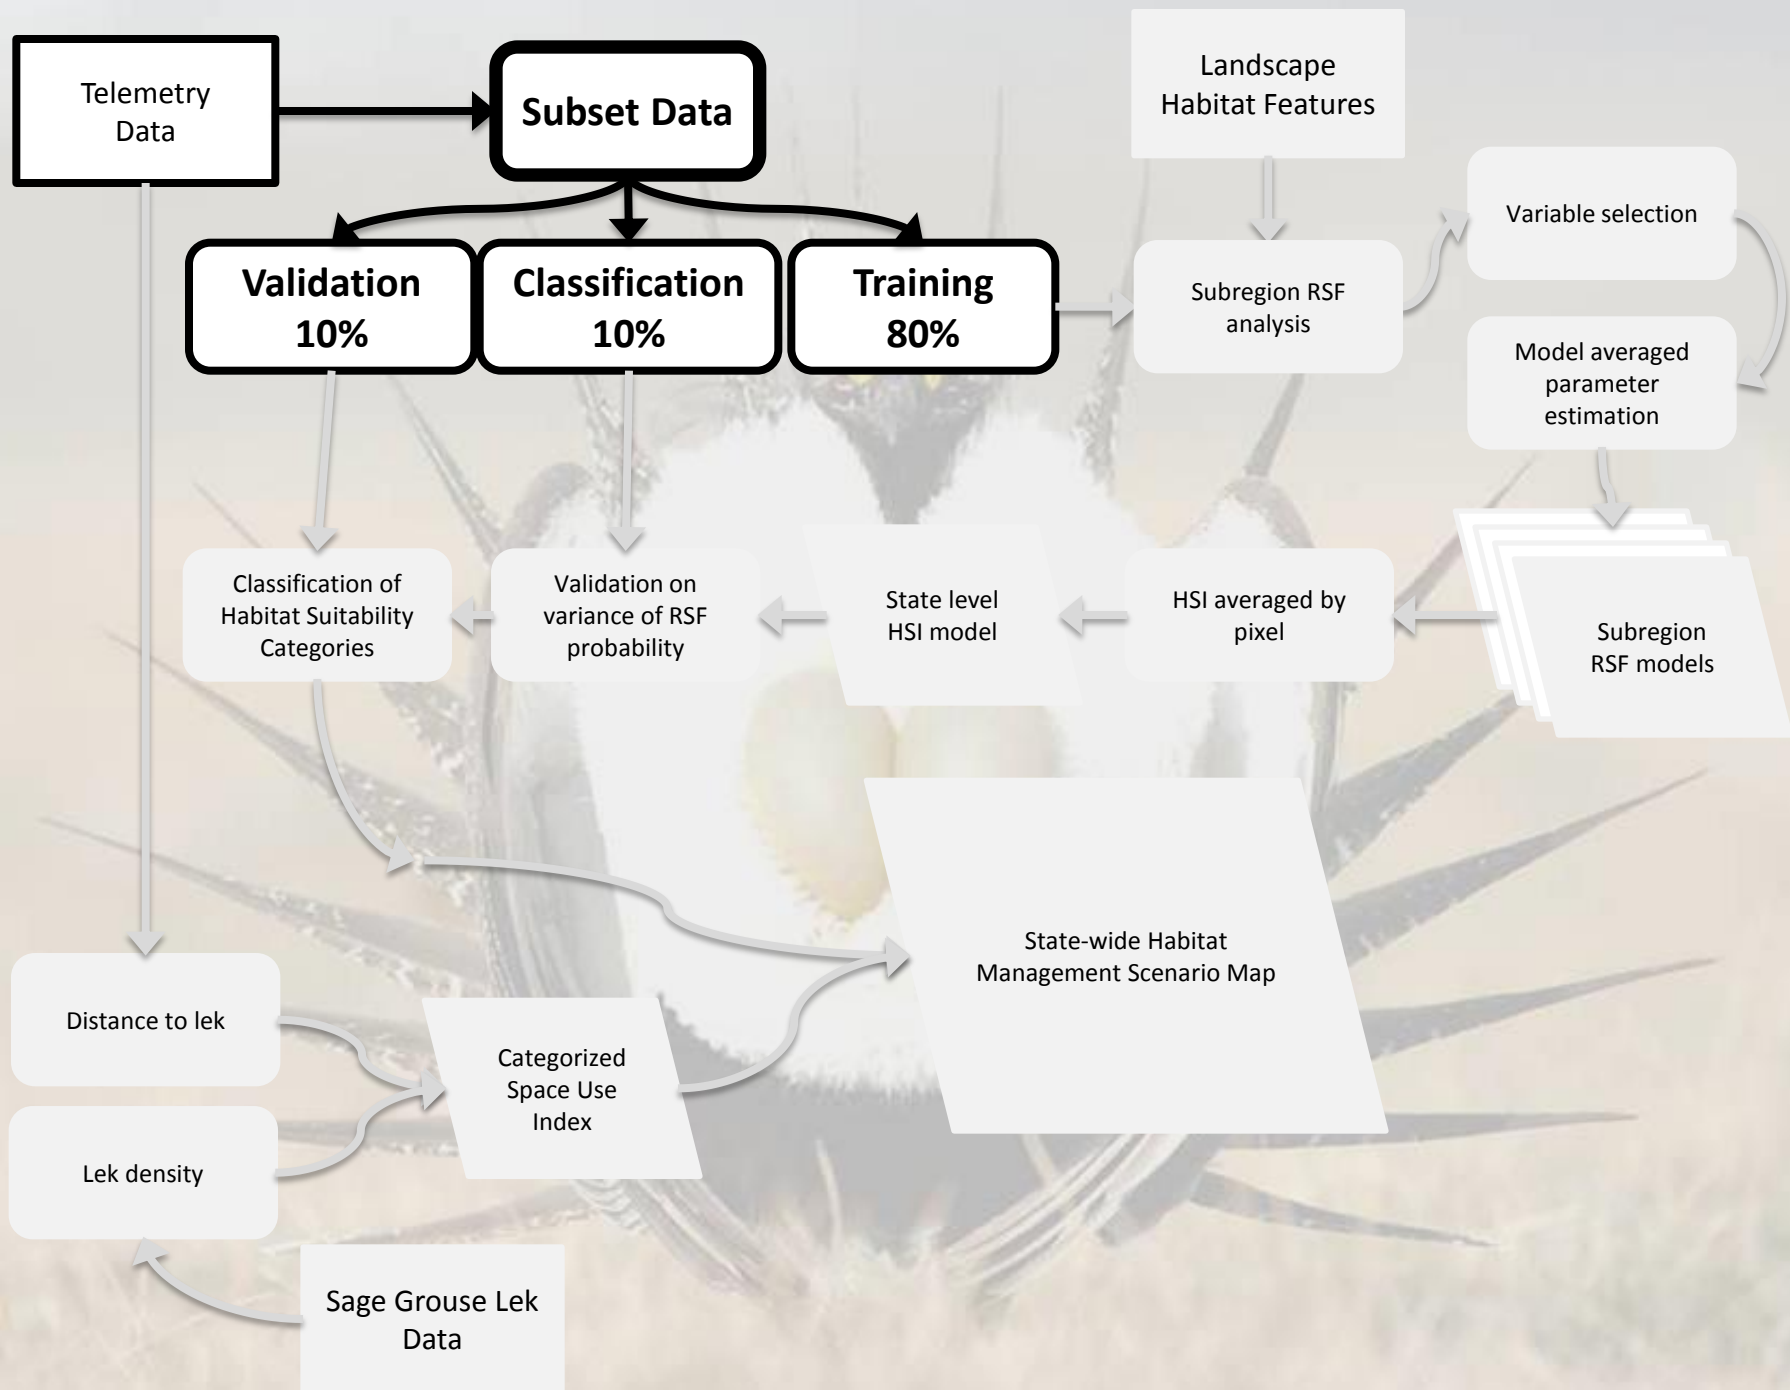

Defining the Modeling Area

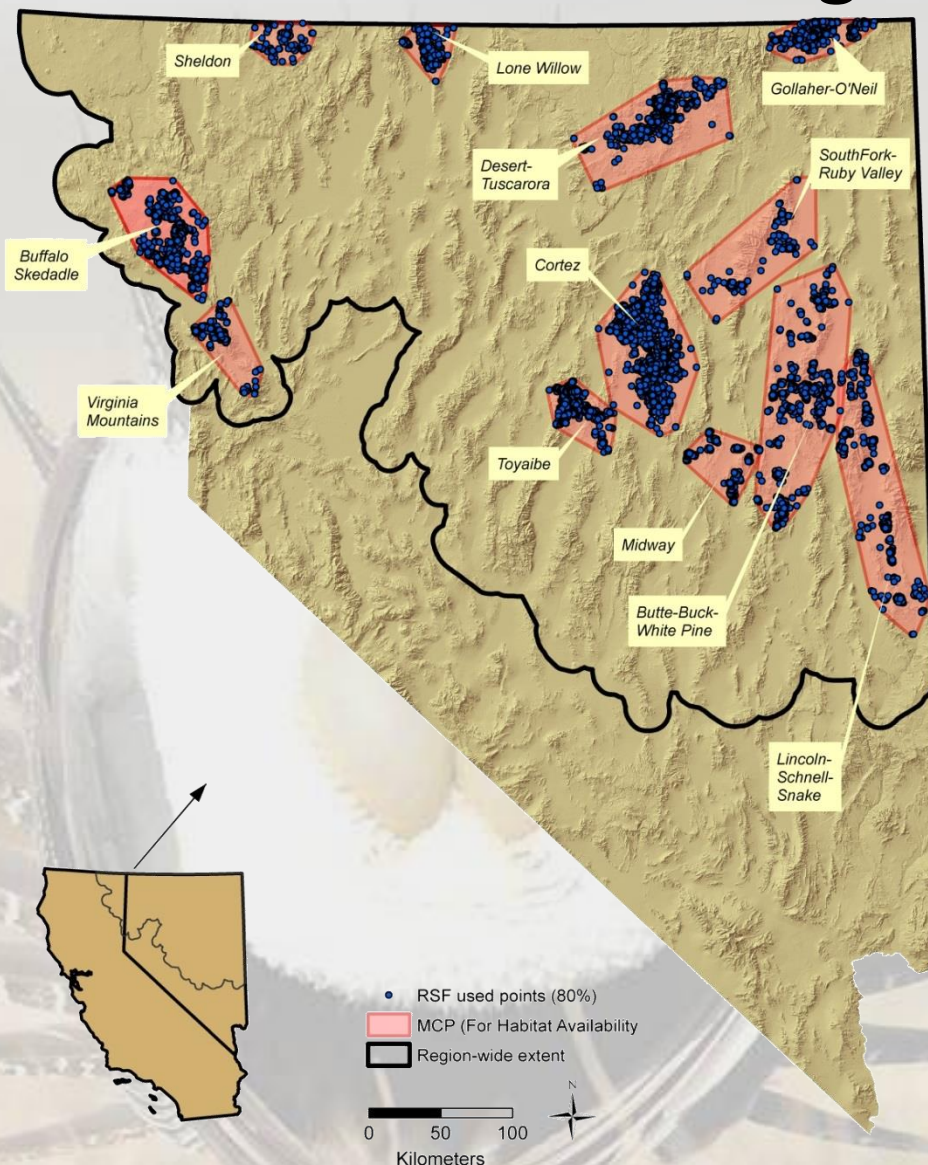

Used existing PMU
boundaries (10 km)

Approximated potential
sage-grouse range

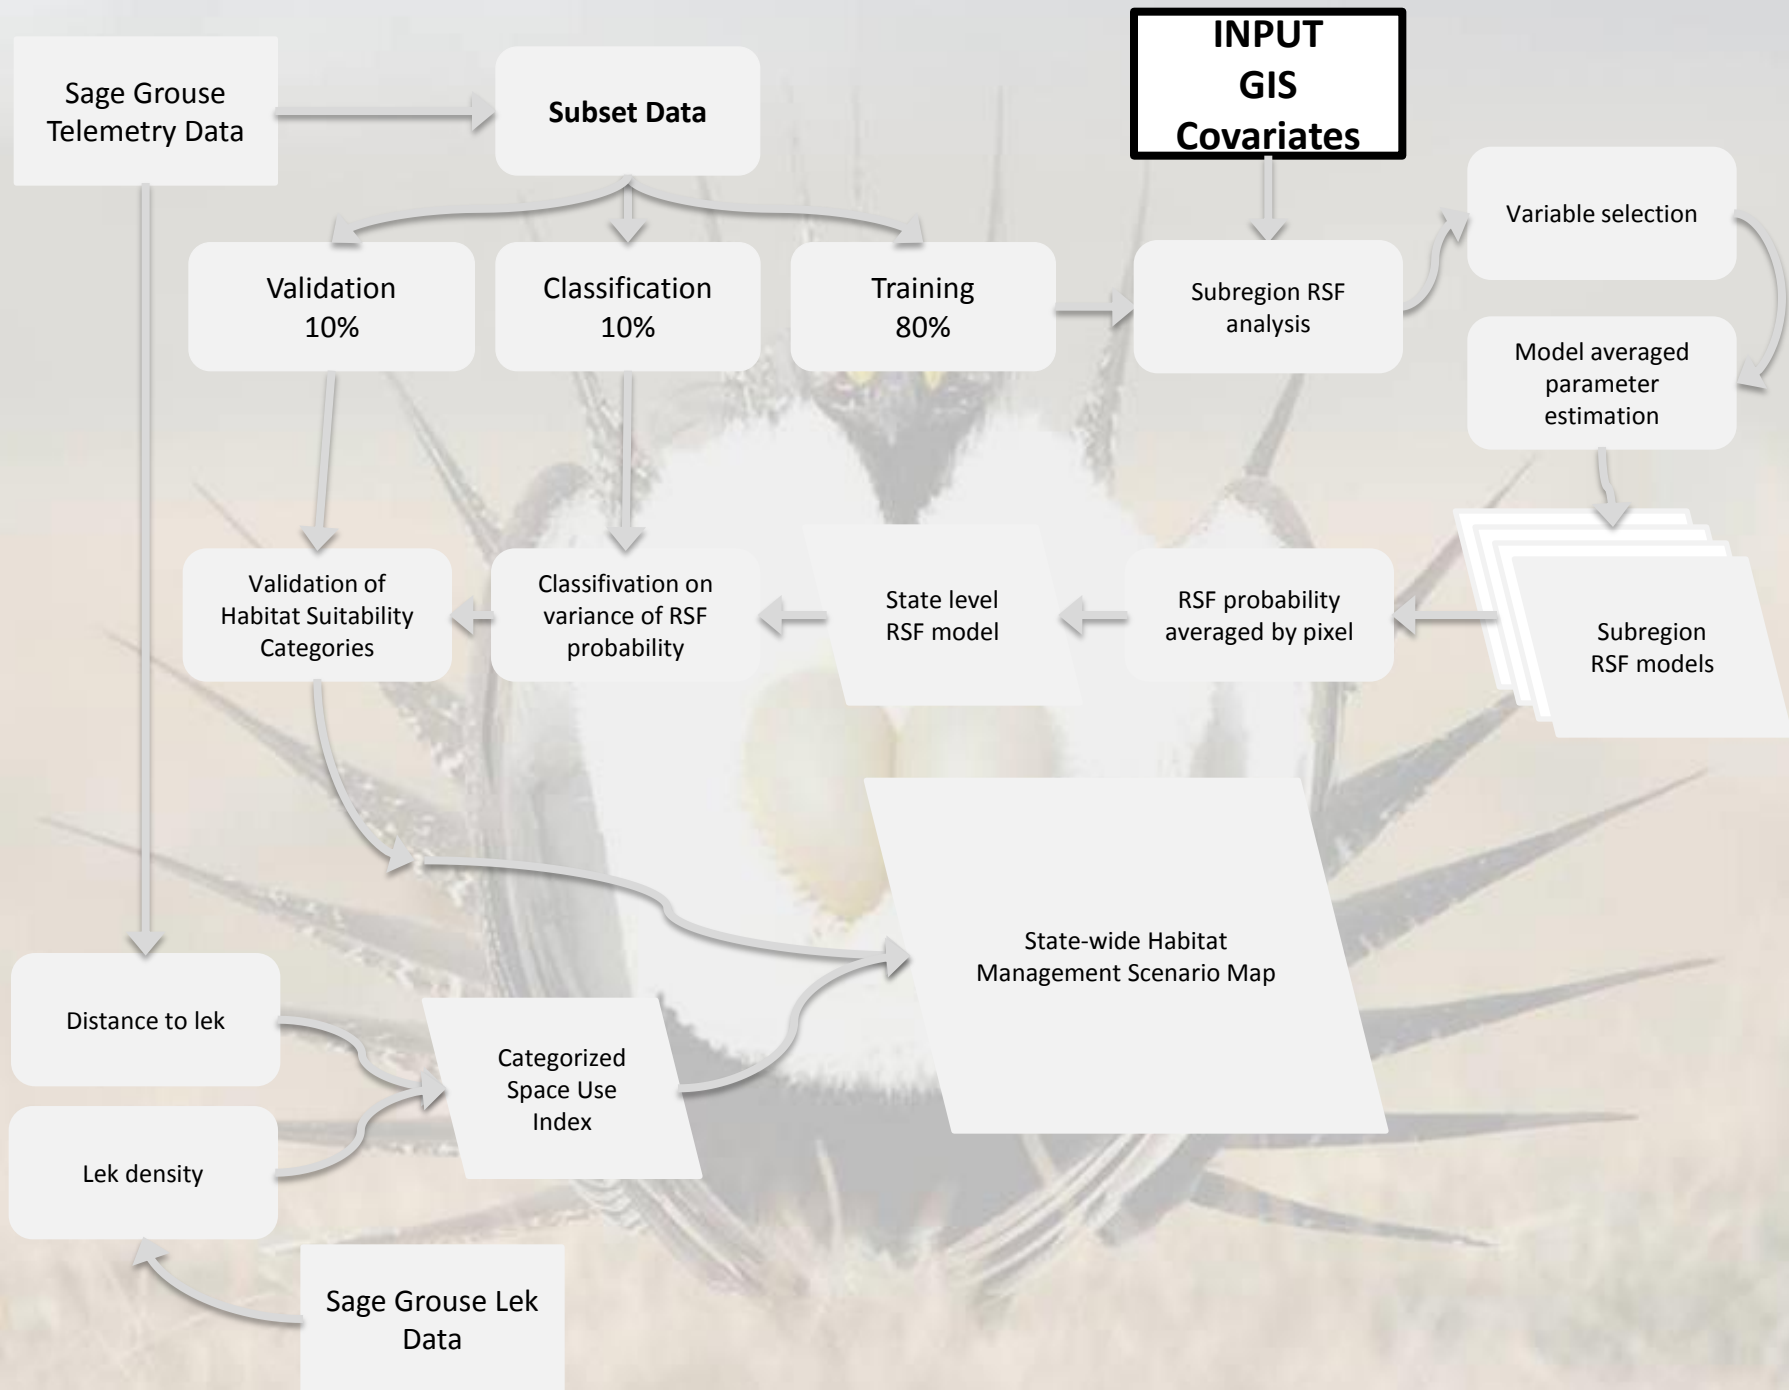

Statewide Modeling

- 12 sub-regions
- 3 seasons (nesting, brood-rearing, wintering)
- 24 site/sub-region Resource Section Function (RSF) maps
- > 16 years of data
- > 37,000 location
- > 1,700 grouse

Three independent datasets:

- Model Training
- Category Training
- Validation

Land Cover Maps

Model Covariates

Vegetation Communities

Agricultural Areas

Topographic Indices

Elevation Model

Anthropogenic
Attributes

- Urbanization

- Recreational Indices

- *Power Lines**

Physiographic Variables

Ruggedness Index

Elevation

Improvement on Land Cover Inputs

- **Sagebrush Ecosystem Quantification Products for the Great Basin**
 - **USGS-Earth Resources Observation Sciences Lab (C. Homer)**
 - **Integrates high-resolution Quickbird (< 2-m) satellite imagery with larger scenes of Landsat 8 (30-m) imagery**
 - **Model output = 30-m pixels with land cover expressed as percent cover (0 – 100%)**
- **In contrast, Landsat-based Nevada SYNTH map expresses land cover as a binary (0 or 1) value at 30-m resolution**

Sagebrush Land Cover Types

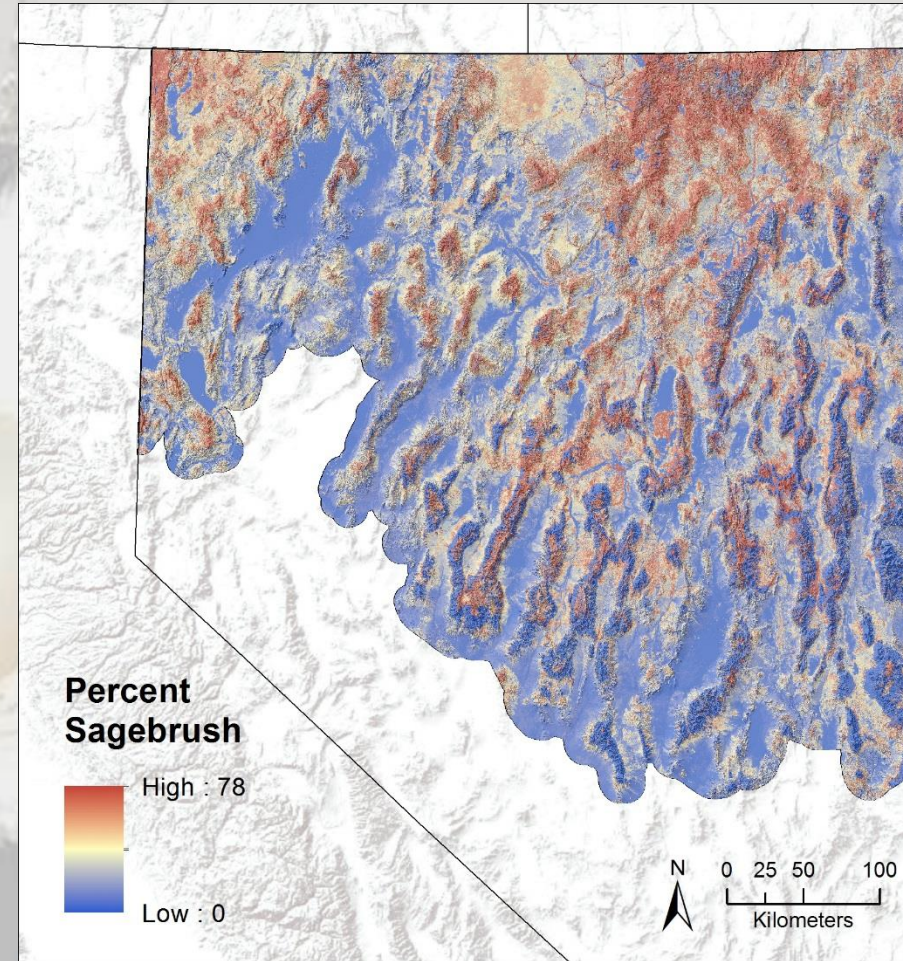

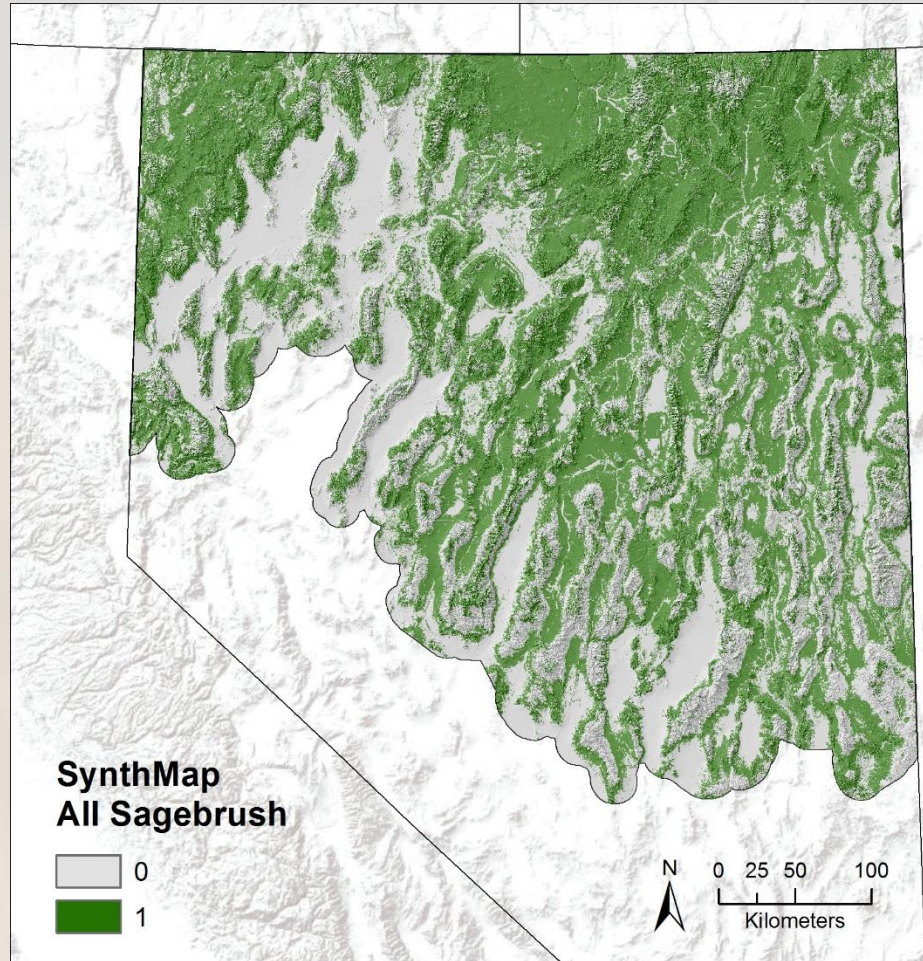

Previous version (Coates et al. 2014) was based on 30-m classification (NV Synthmap)

Sagebrush Land Cover Types

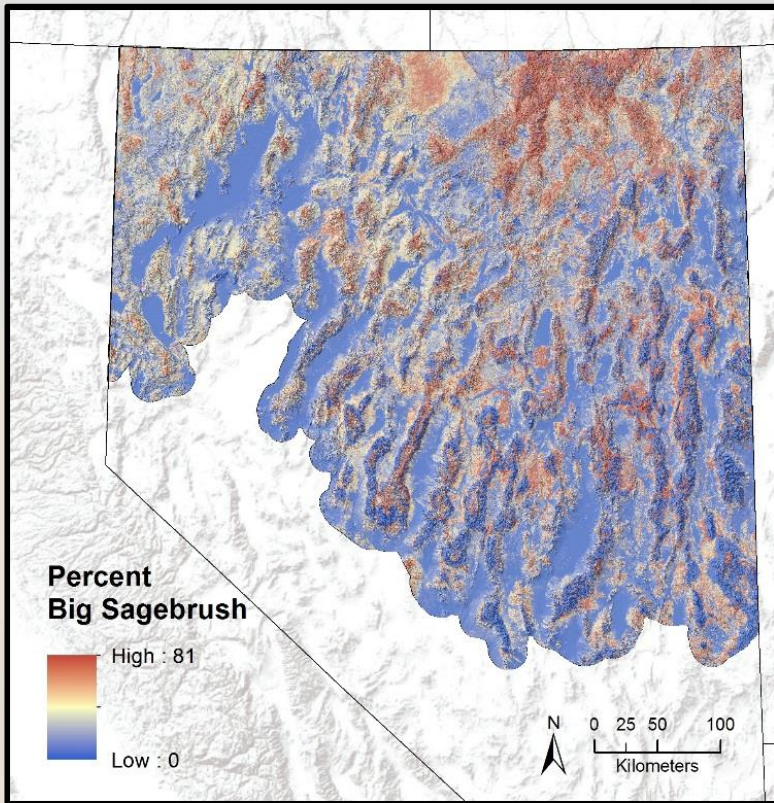

Recent version is based on <2-m resolution (Homer et al., In Prep)

Sagebrush Land Cover Types

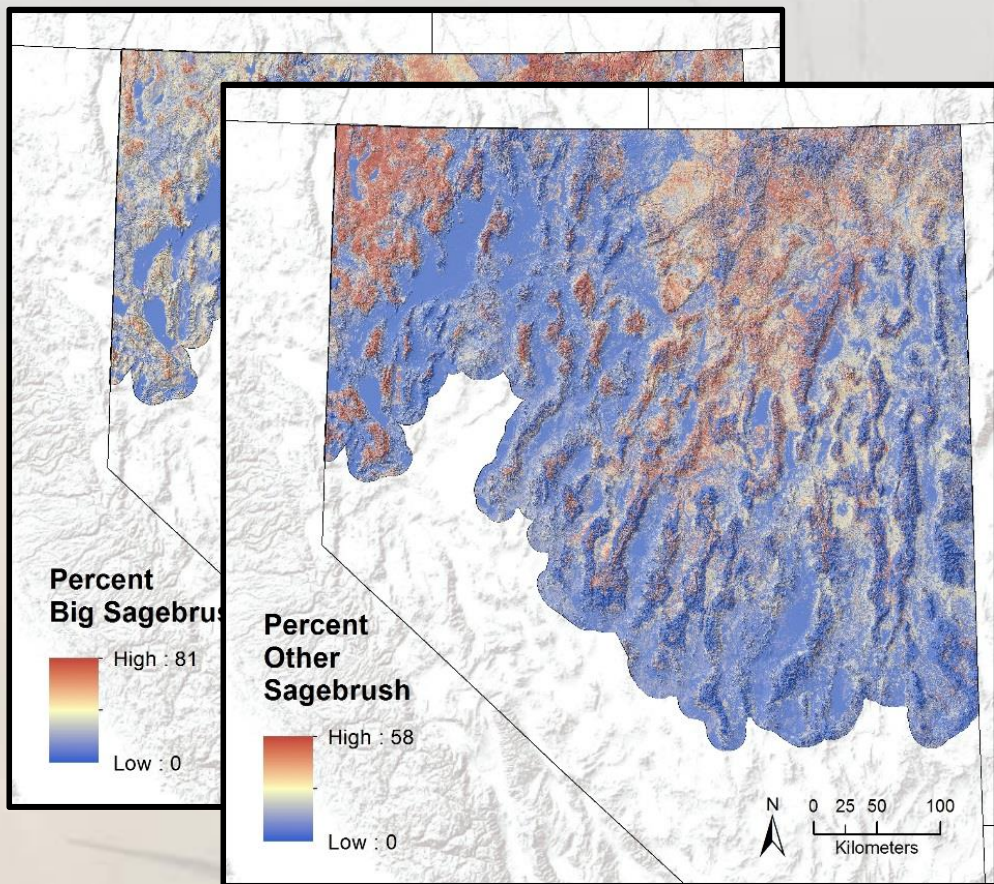

Improved Land Cover Types

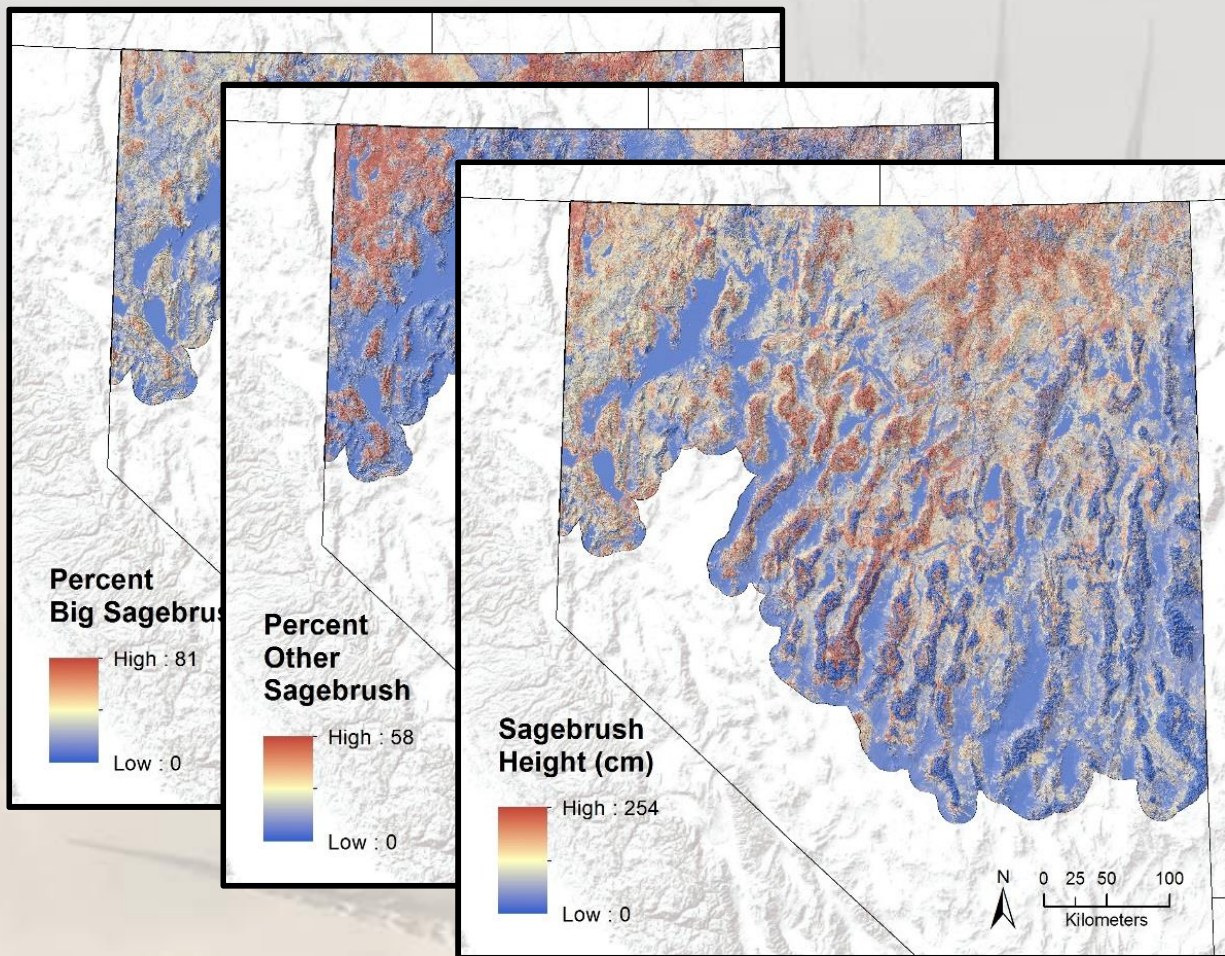

Big Sagebrush

Improved Land Cover Types

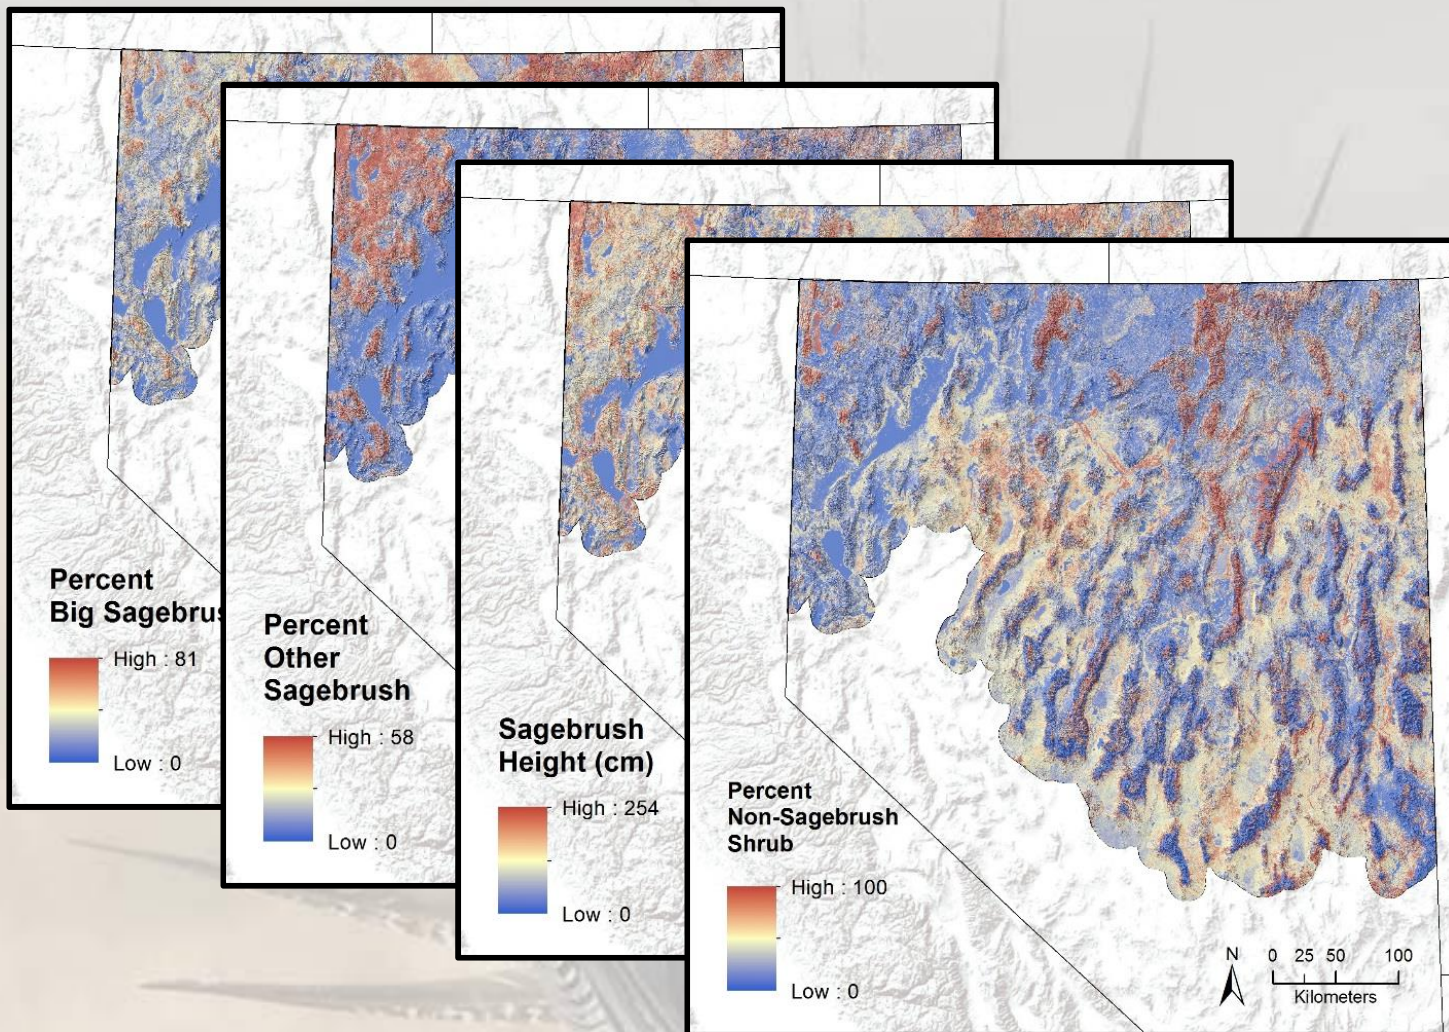

Low Sagebrush

Improved Land Cover Types

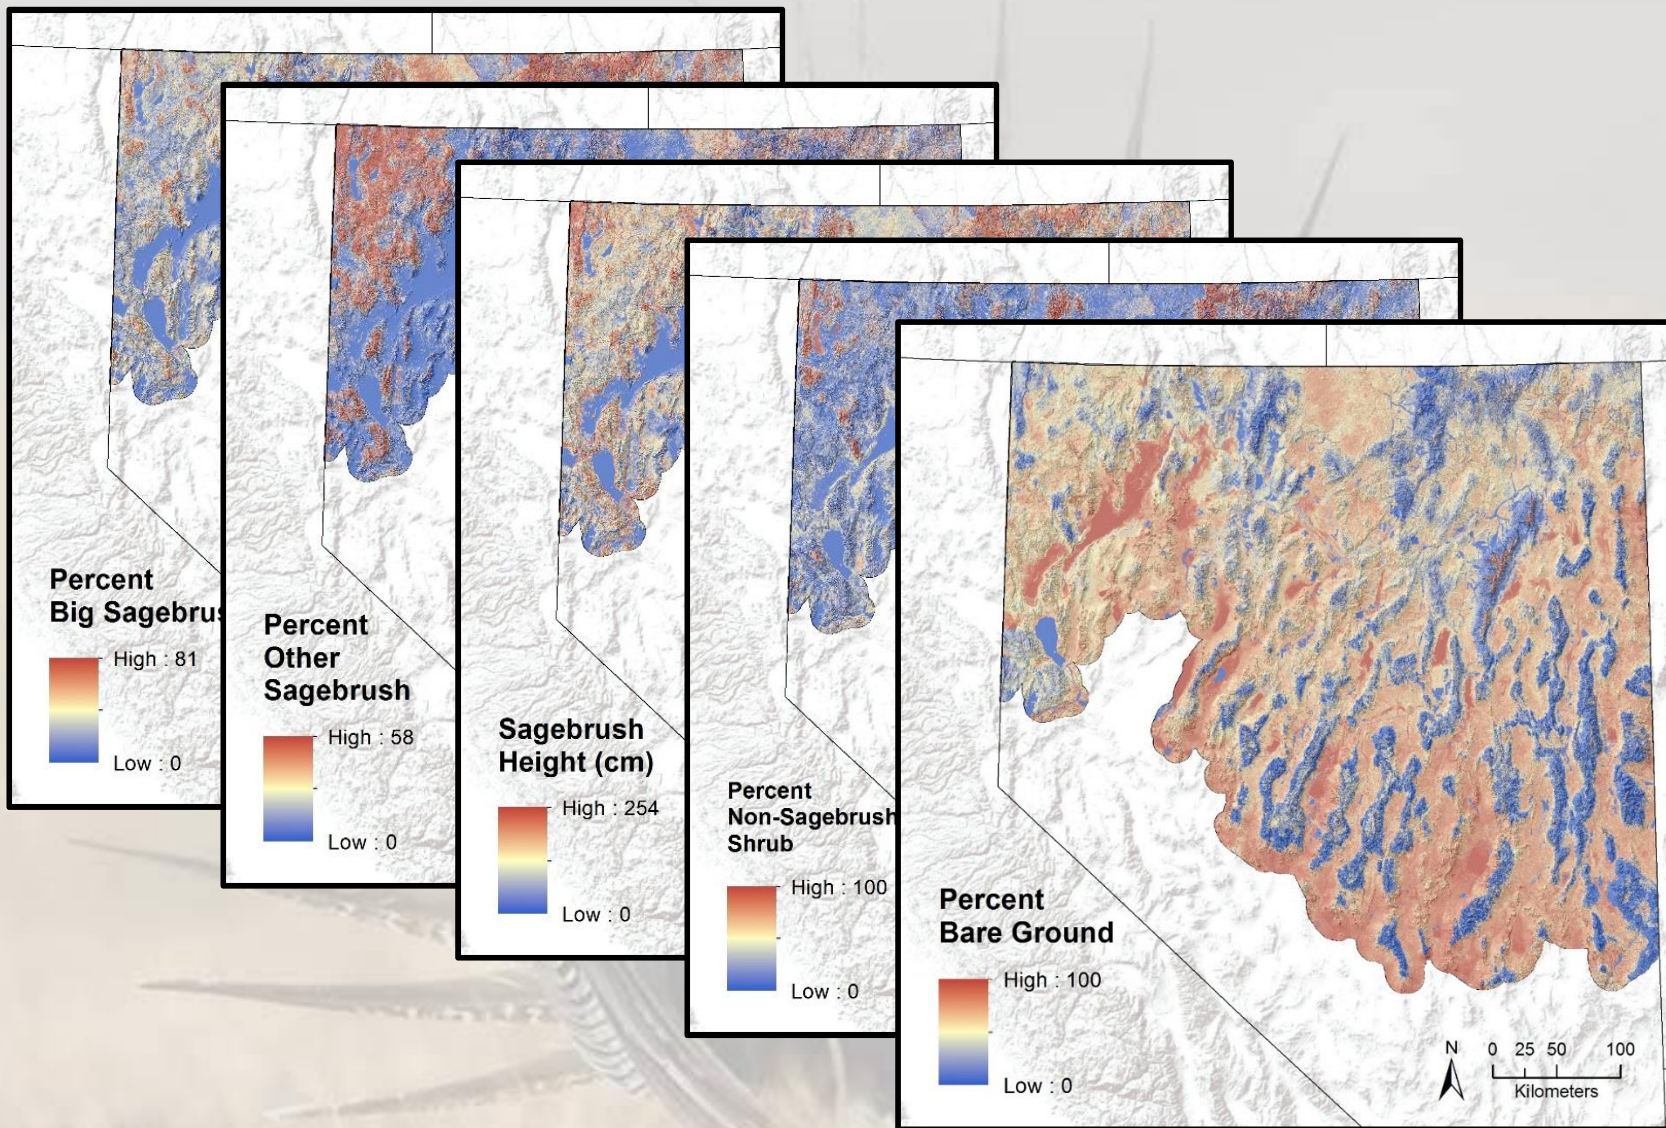

Sagebrush Height

Improved Land Cover Types

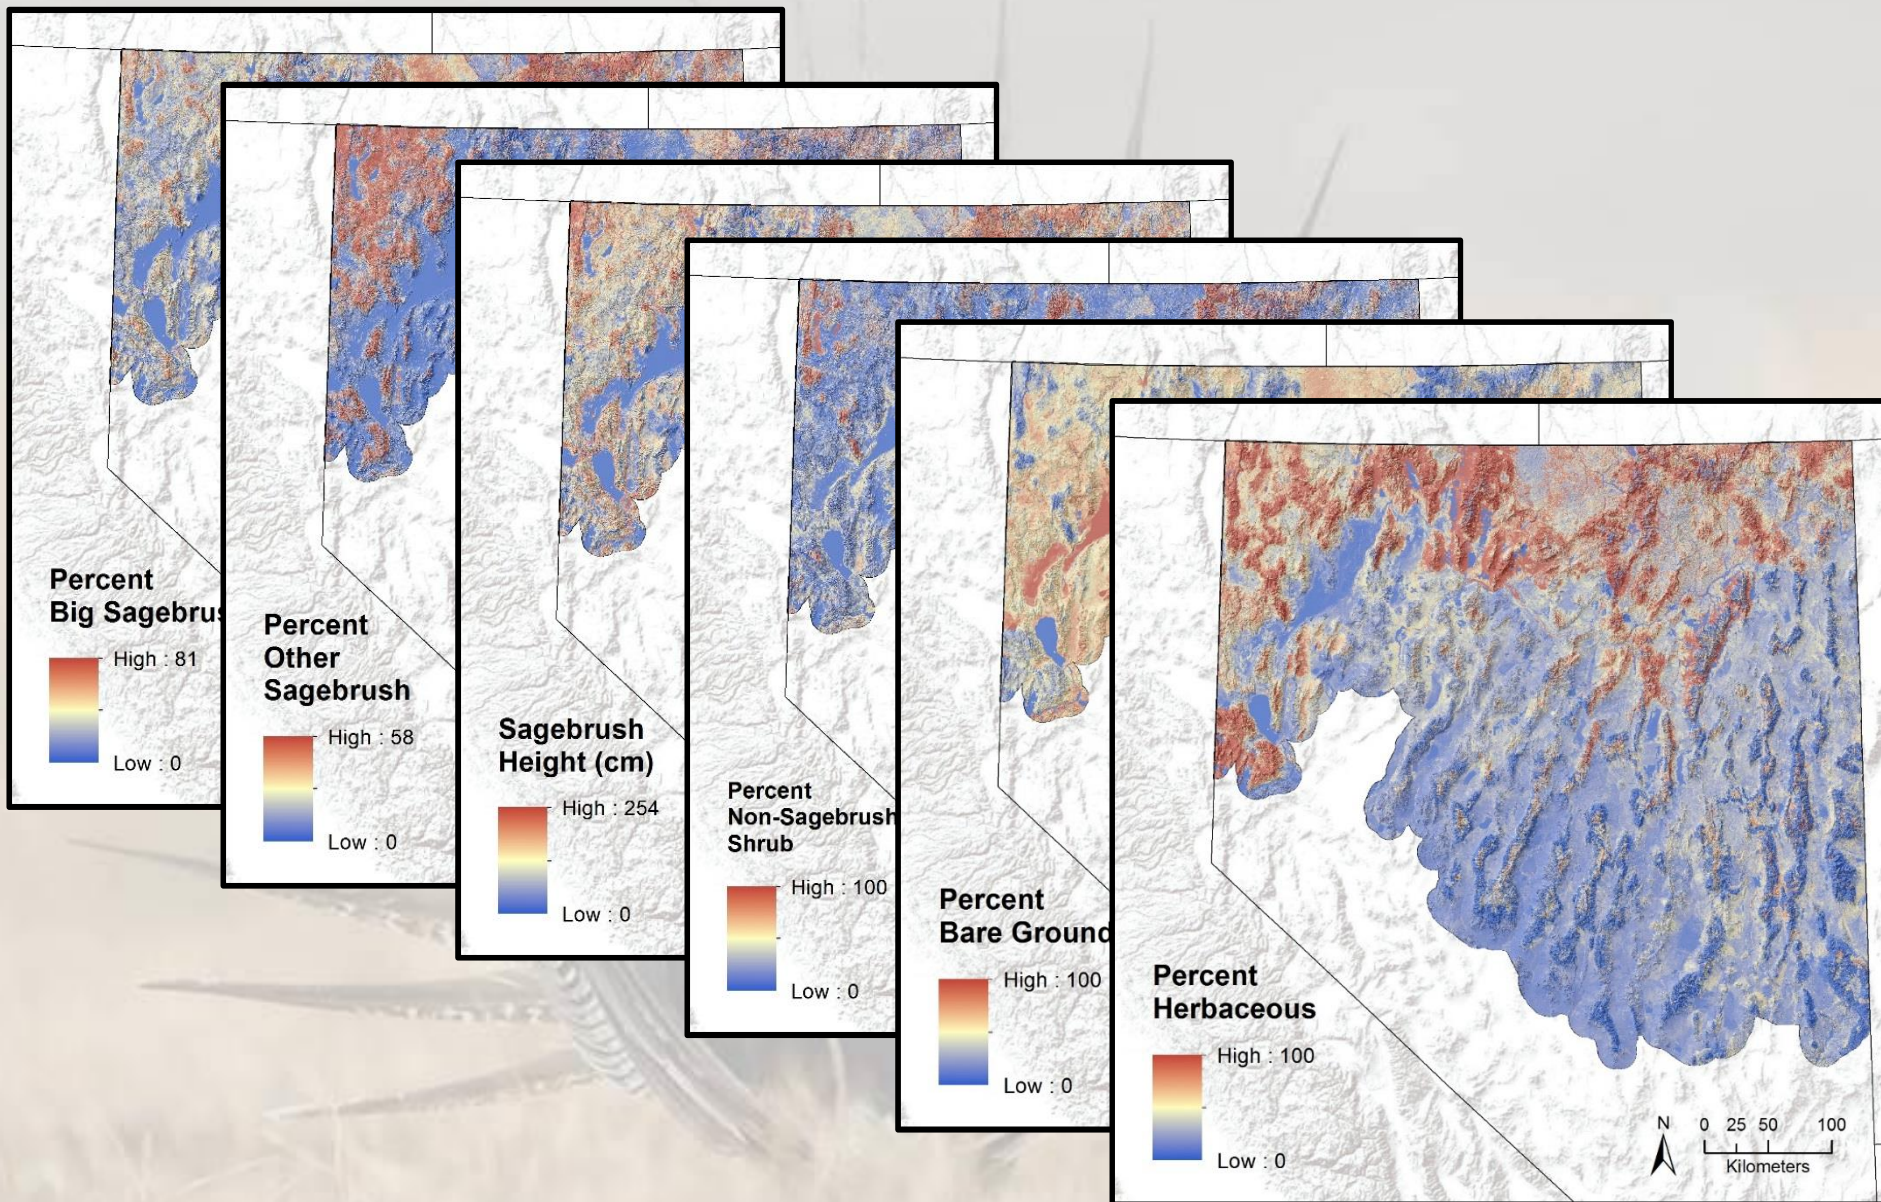

Non-sagebrush

Improved Land Cover Types

Bareground

Improved Land Cover Types

Herbaceous

Improvement on PJ Inputs

- Existing 30-m resolution PJ not ideal for habitat mapping
- Sage-grouse show strong avoidance of PJ
- Low cover of PJ over sagebrush can greatly diminish value of otherwise high quality habitat
- ‘In house’ and multi-year effort-map to PJ at 1-m resolution to greatly improve habitat models.

Conifer Land Cover Types

NAIP imagery (black dots are trees)

Conifer Land Cover Types

Previous version (Coates et al. 2014) was based on 30-m classification (NV Synthmap)

Conifer Land Cover Types

NAIP imagery (black dots are trees)

- > 7,000 tiles state-wide analyzed
- Time and computationally intensive process

***Continuous
surface that can
be modeled as a
percentage***

Conifer Cover Classes

Green
Class 1

Blue
Class 2

Red
Class 3

*Use object
recognition
software*

*Continuous
surface that
can be
modeled as a
percentage*

Can also be reclassified into ecologically relevant cover classes for a wide range of management applications.

Locations of sage-grouse using GPS and VHF telemetry

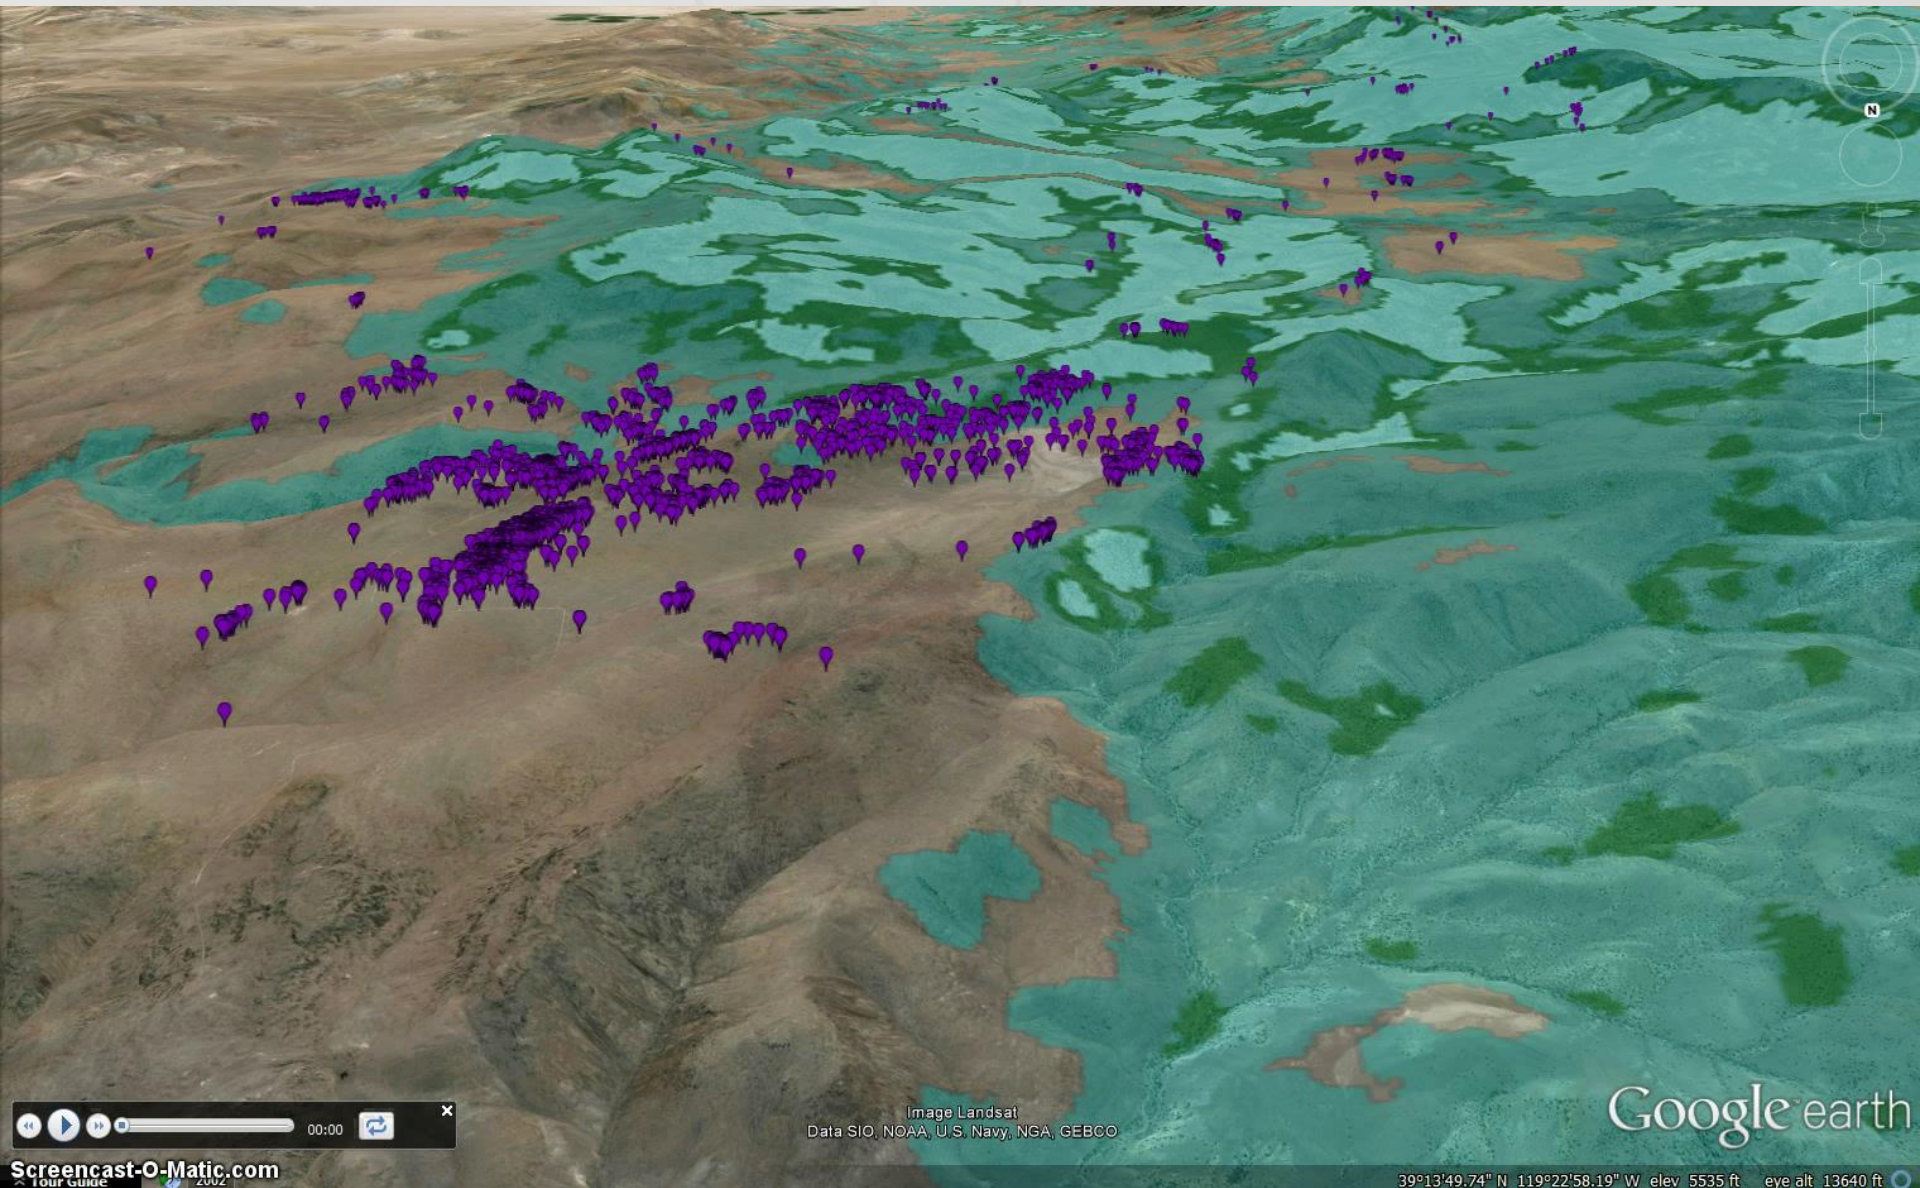

Image Landsat
Data SIO, NOAA, U.S. Navy, NGA, GEBCO

Google earth

39°13'49.74" N 119°22'58.19" W elev 5535 ft eye alt 13640 ft

Media playback controls including a play button, a progress bar showing 00:00, and a close button (X).

Landcover Update Summary

Previous (30-m based)

Updated (< 2-m based)

Bare ground

% Bare ground

All sagebrush

% Big sagebrush

% Low sagebrush

Lowland shrub

% Non-sagebrush

Upland shrub

% Non-sagebrush

Pinyon Juniper

% Pinyon Juniper

none

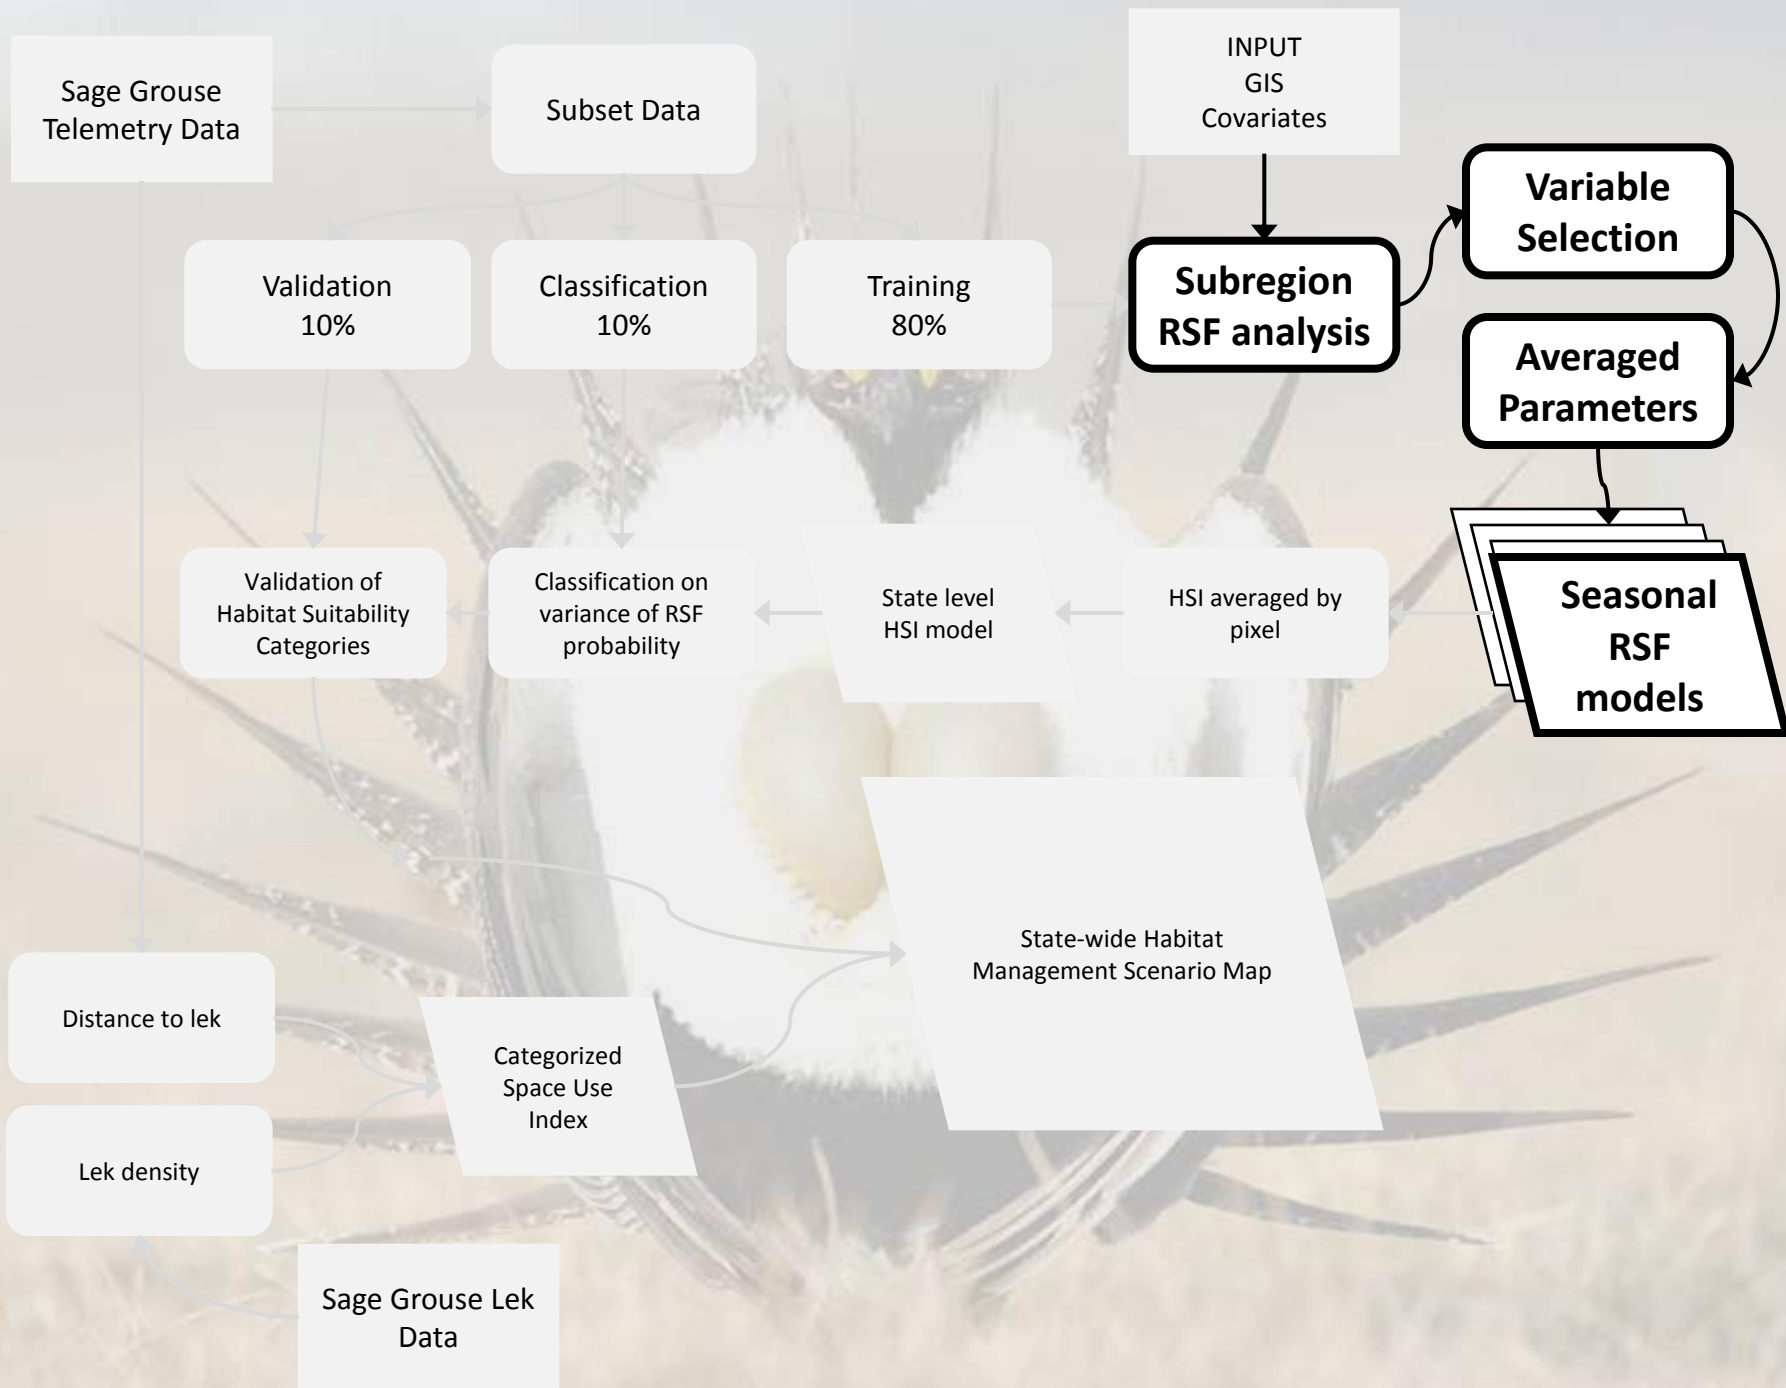

% Pinyon Juniper Understory

none

% Herbaceous (interspace)

none

Urban masked

Citation or Distribution

Habitat Suitability Index (HSI)

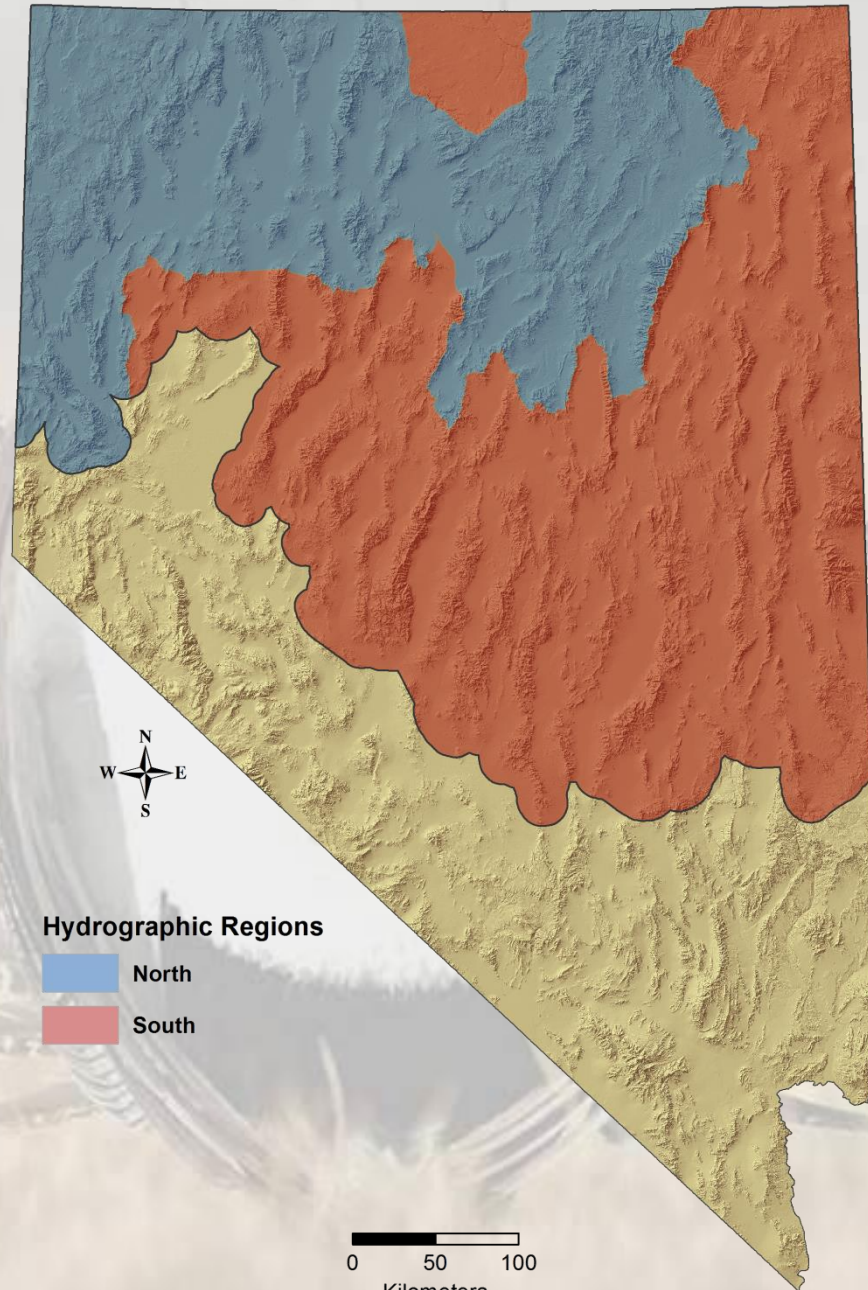

- Measures a statewide relative probability of selection
- Continuous Index (0 to 1)

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

Hydrographic Regions

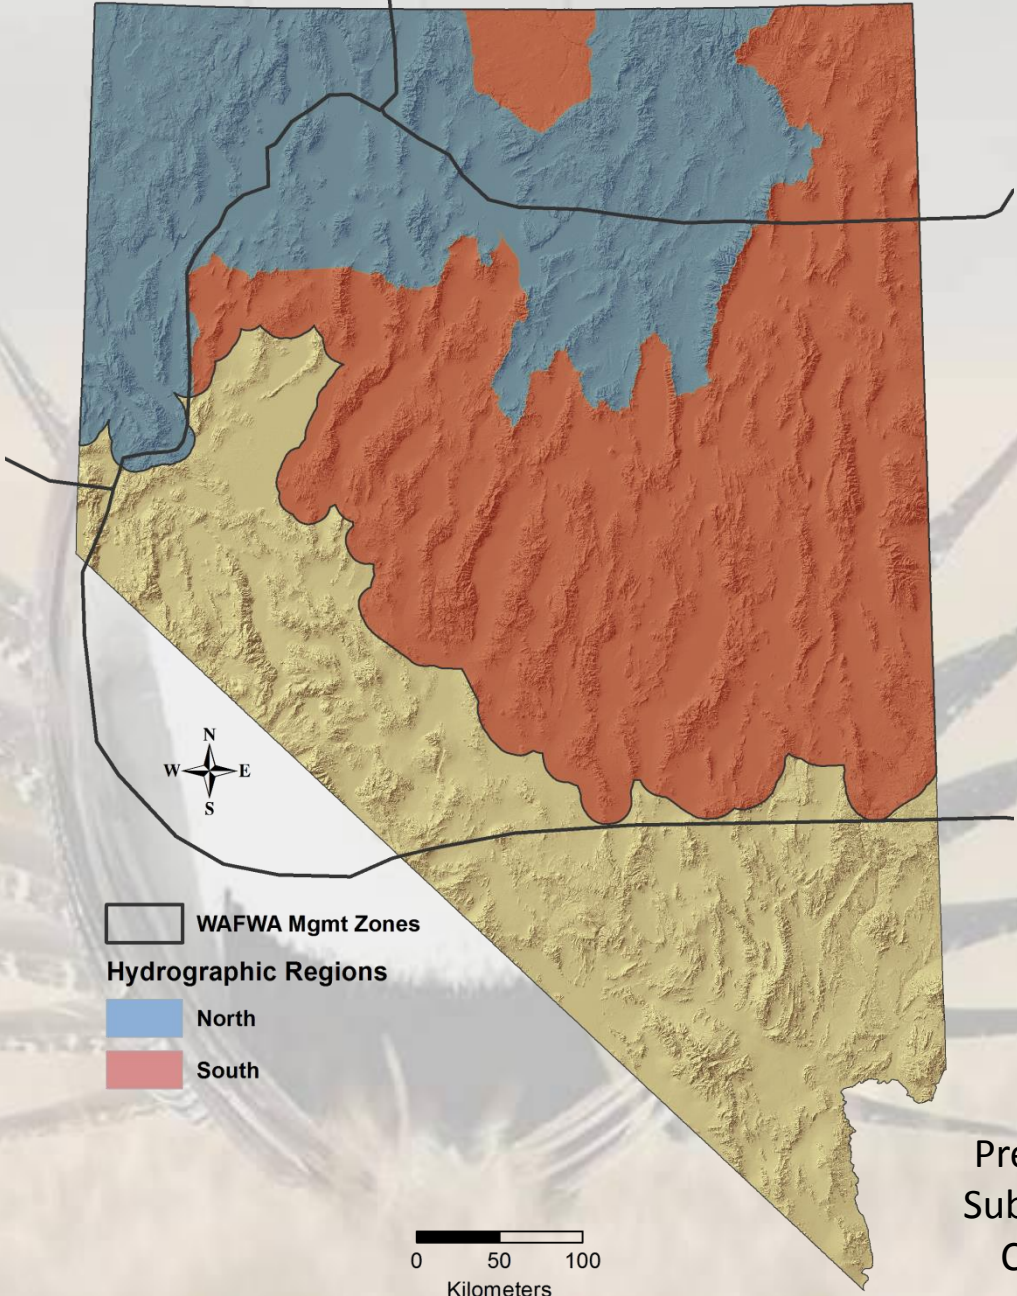

Create 'North' and 'South' regions based on USGS hydrographic regions

- Surrogate for precipitation zones
- Accounts for differences in veg communities and regional habitat selection differences
- Exception was Owyhee Desert

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

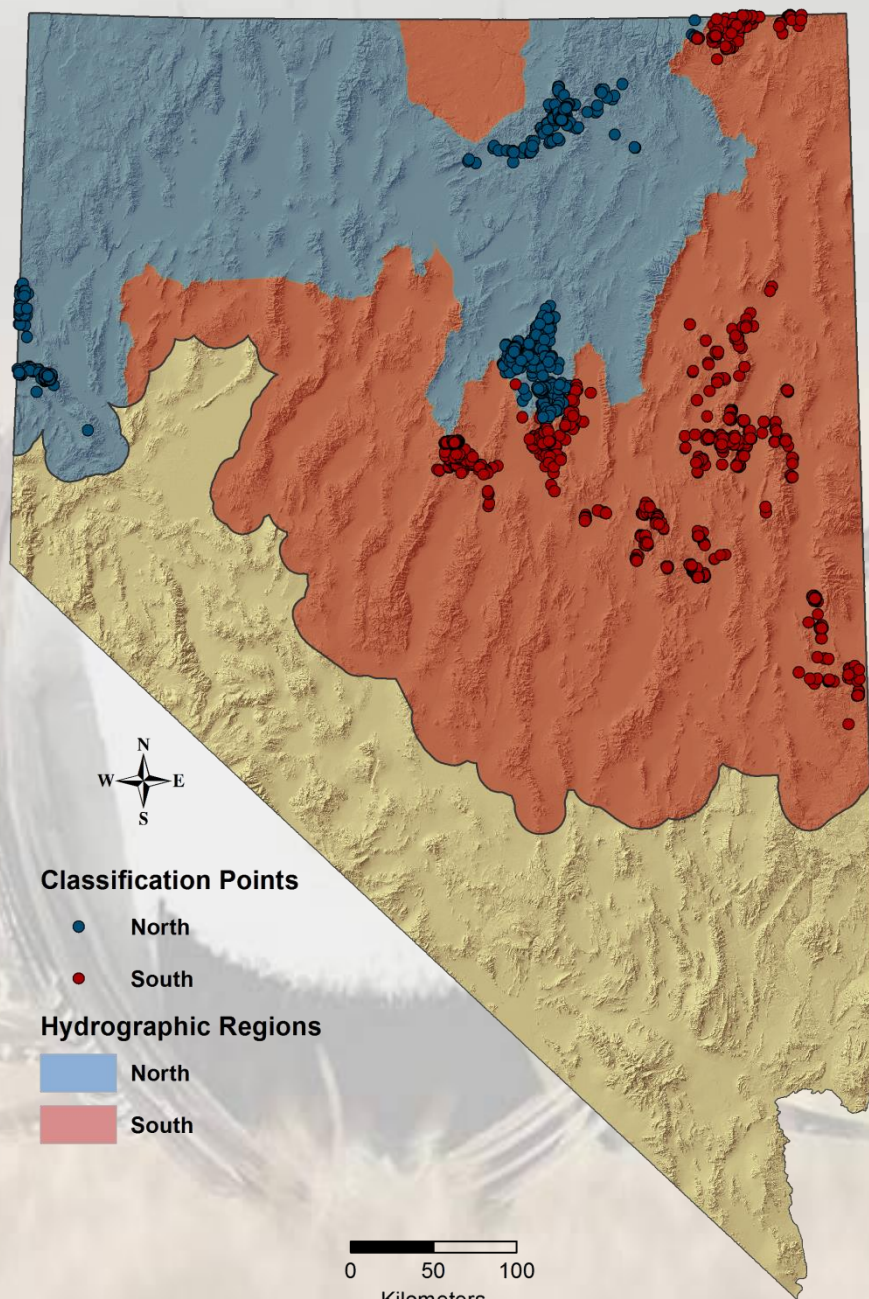

Hydrographic Regions

Roughly corresponds to sage-grouse management zones.

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

Hydrographic Regions

Classification points
split according to
hydrographic regions

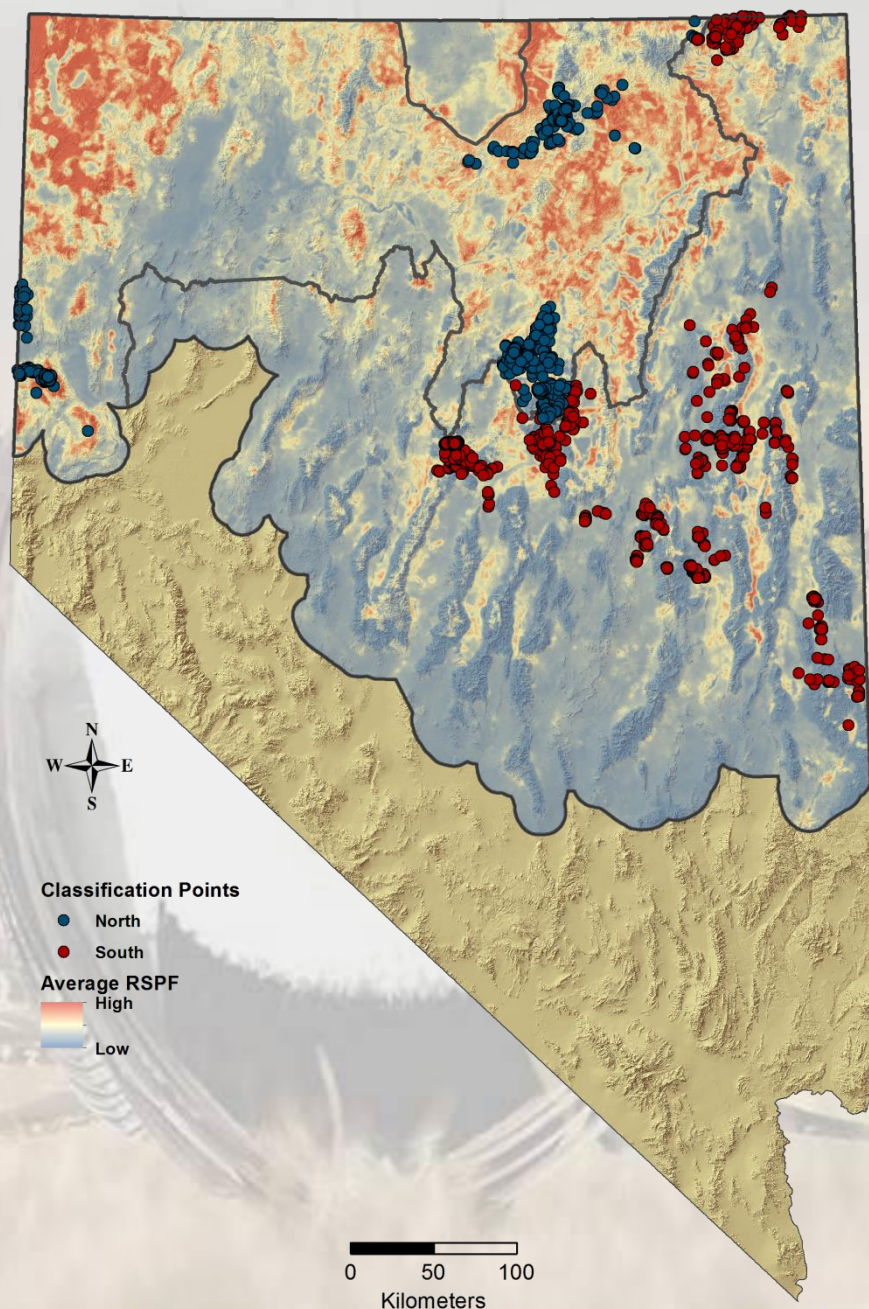

3,766 points used for
classification

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

Hydrographic Regions

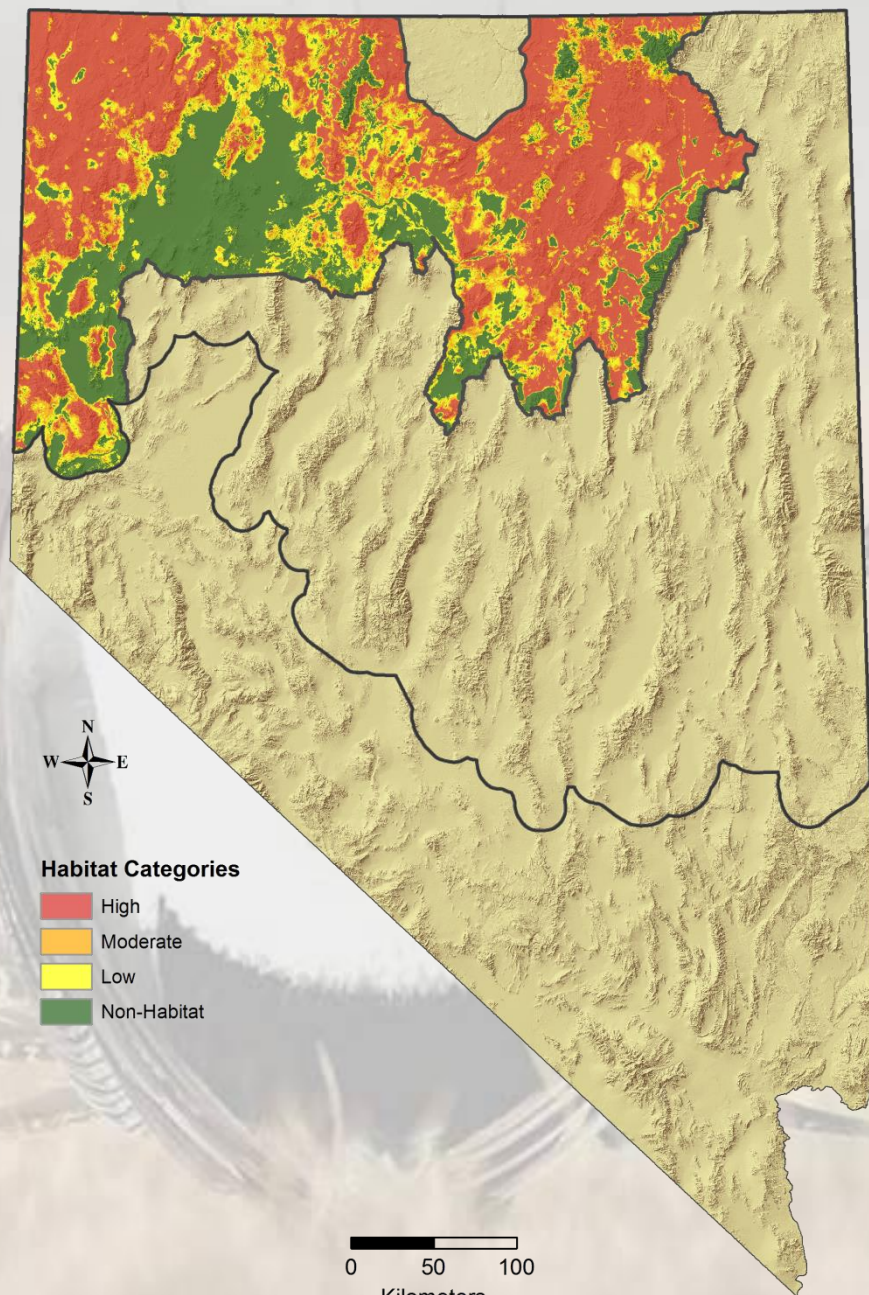

- Extract values to North and South classification points
- Calculate distribution of HSI values by North and South
- Use variance of the HSI distribution to determine classification cutpoints
- Biological and statistical basis for demarcation

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

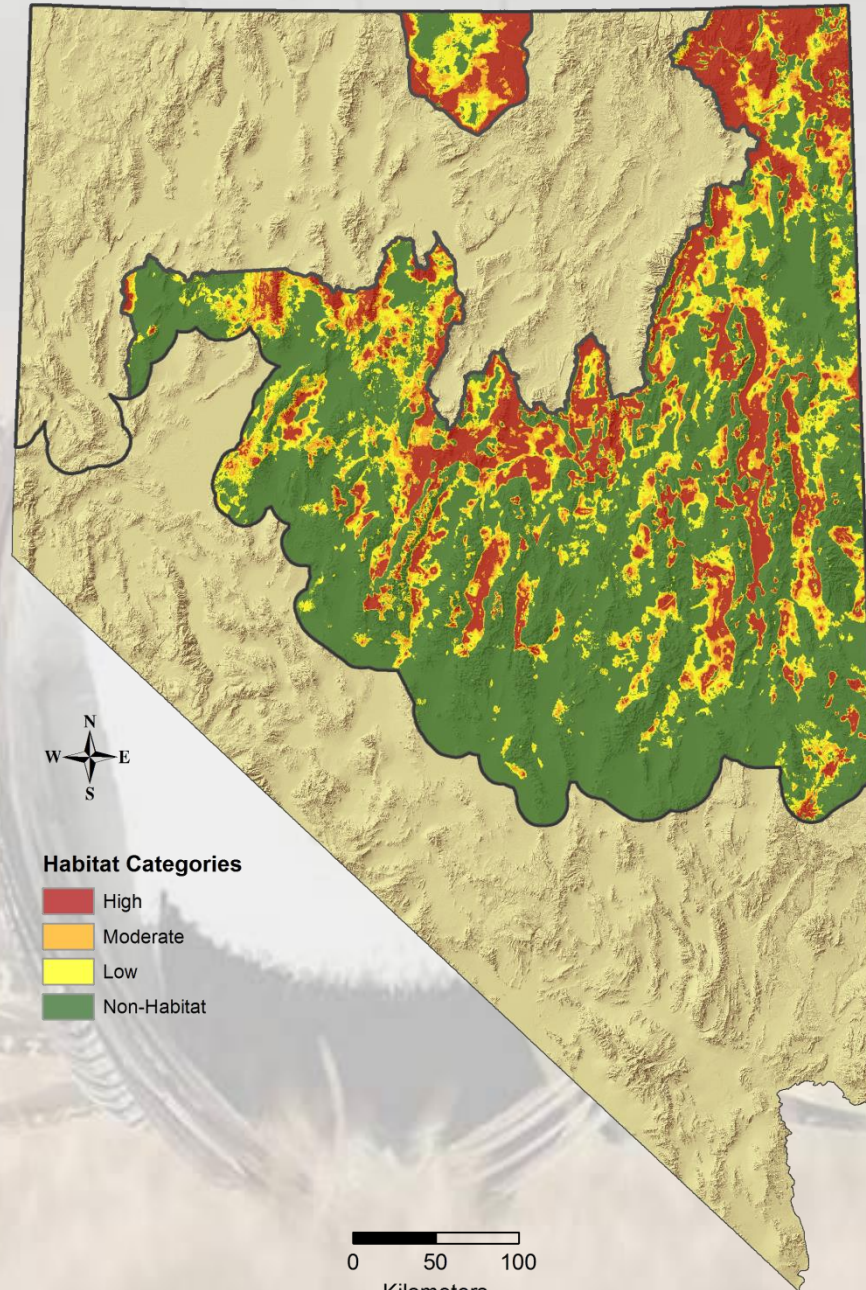

Hydrographic Regions

**Classify habitat
categories with
North hydrographic
classification point
distribution**

**Preliminary Information—
Subject to Revision. Not for
Citation or Distribution**

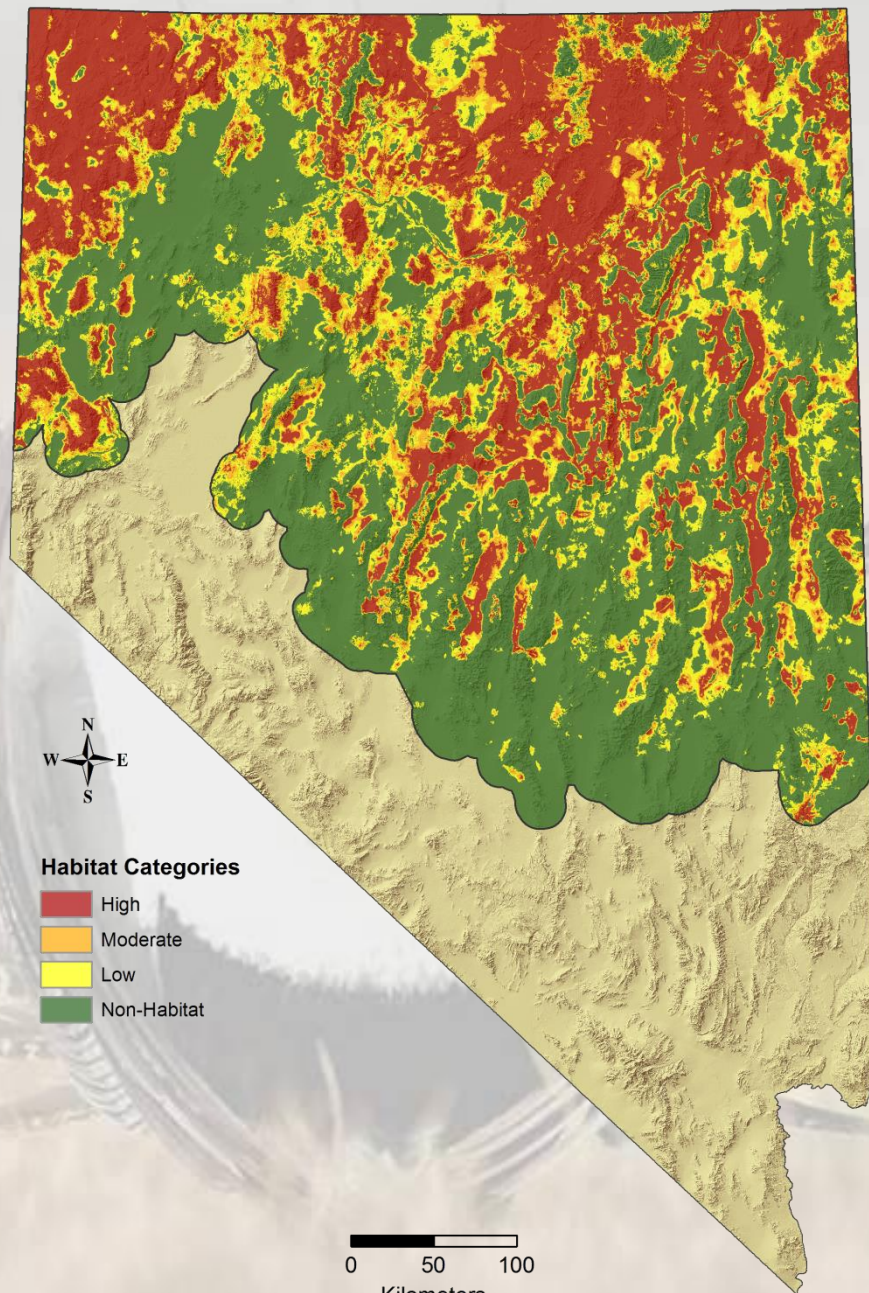

Hydrographic Regions

**Classify habitat
categories using
South hydrographic
classification point
distribution**

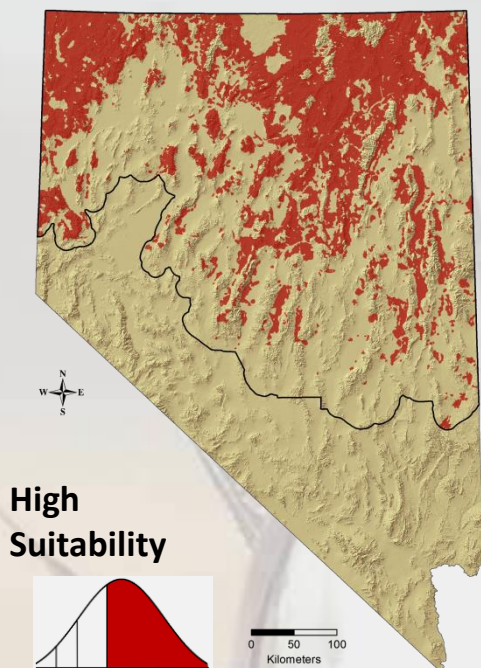

**Preliminary Information—
Subject to Revision. Not for
Citation or Distribution**

Hydrographic Regions

**North and South
Hydrographic Zone
Mosaic**

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

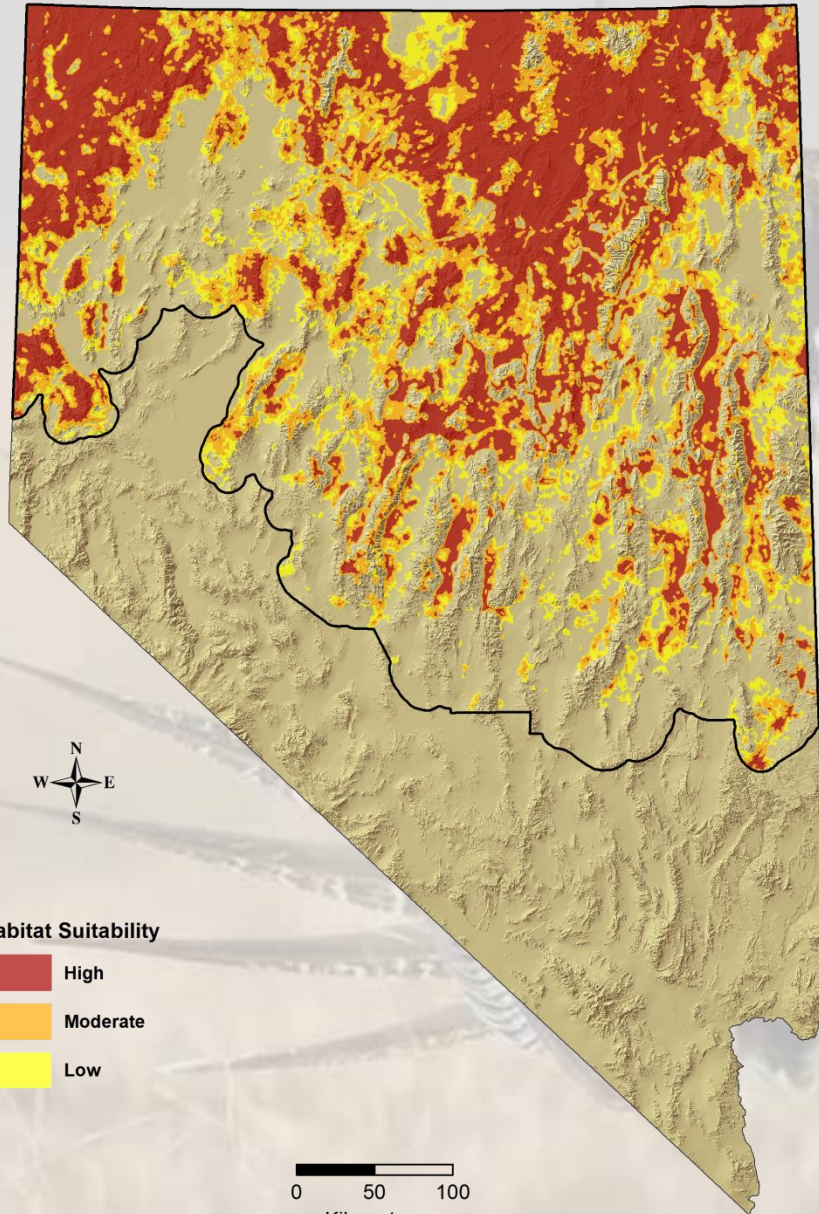

Use variance of the HSI distribution to determine suitability cutpoints (e.g. standard deviations)

Criteria was set in terms of standard deviations below the mean HSI value:

- High = 0.5
- Moderate = 1.0
- Low = 1.5

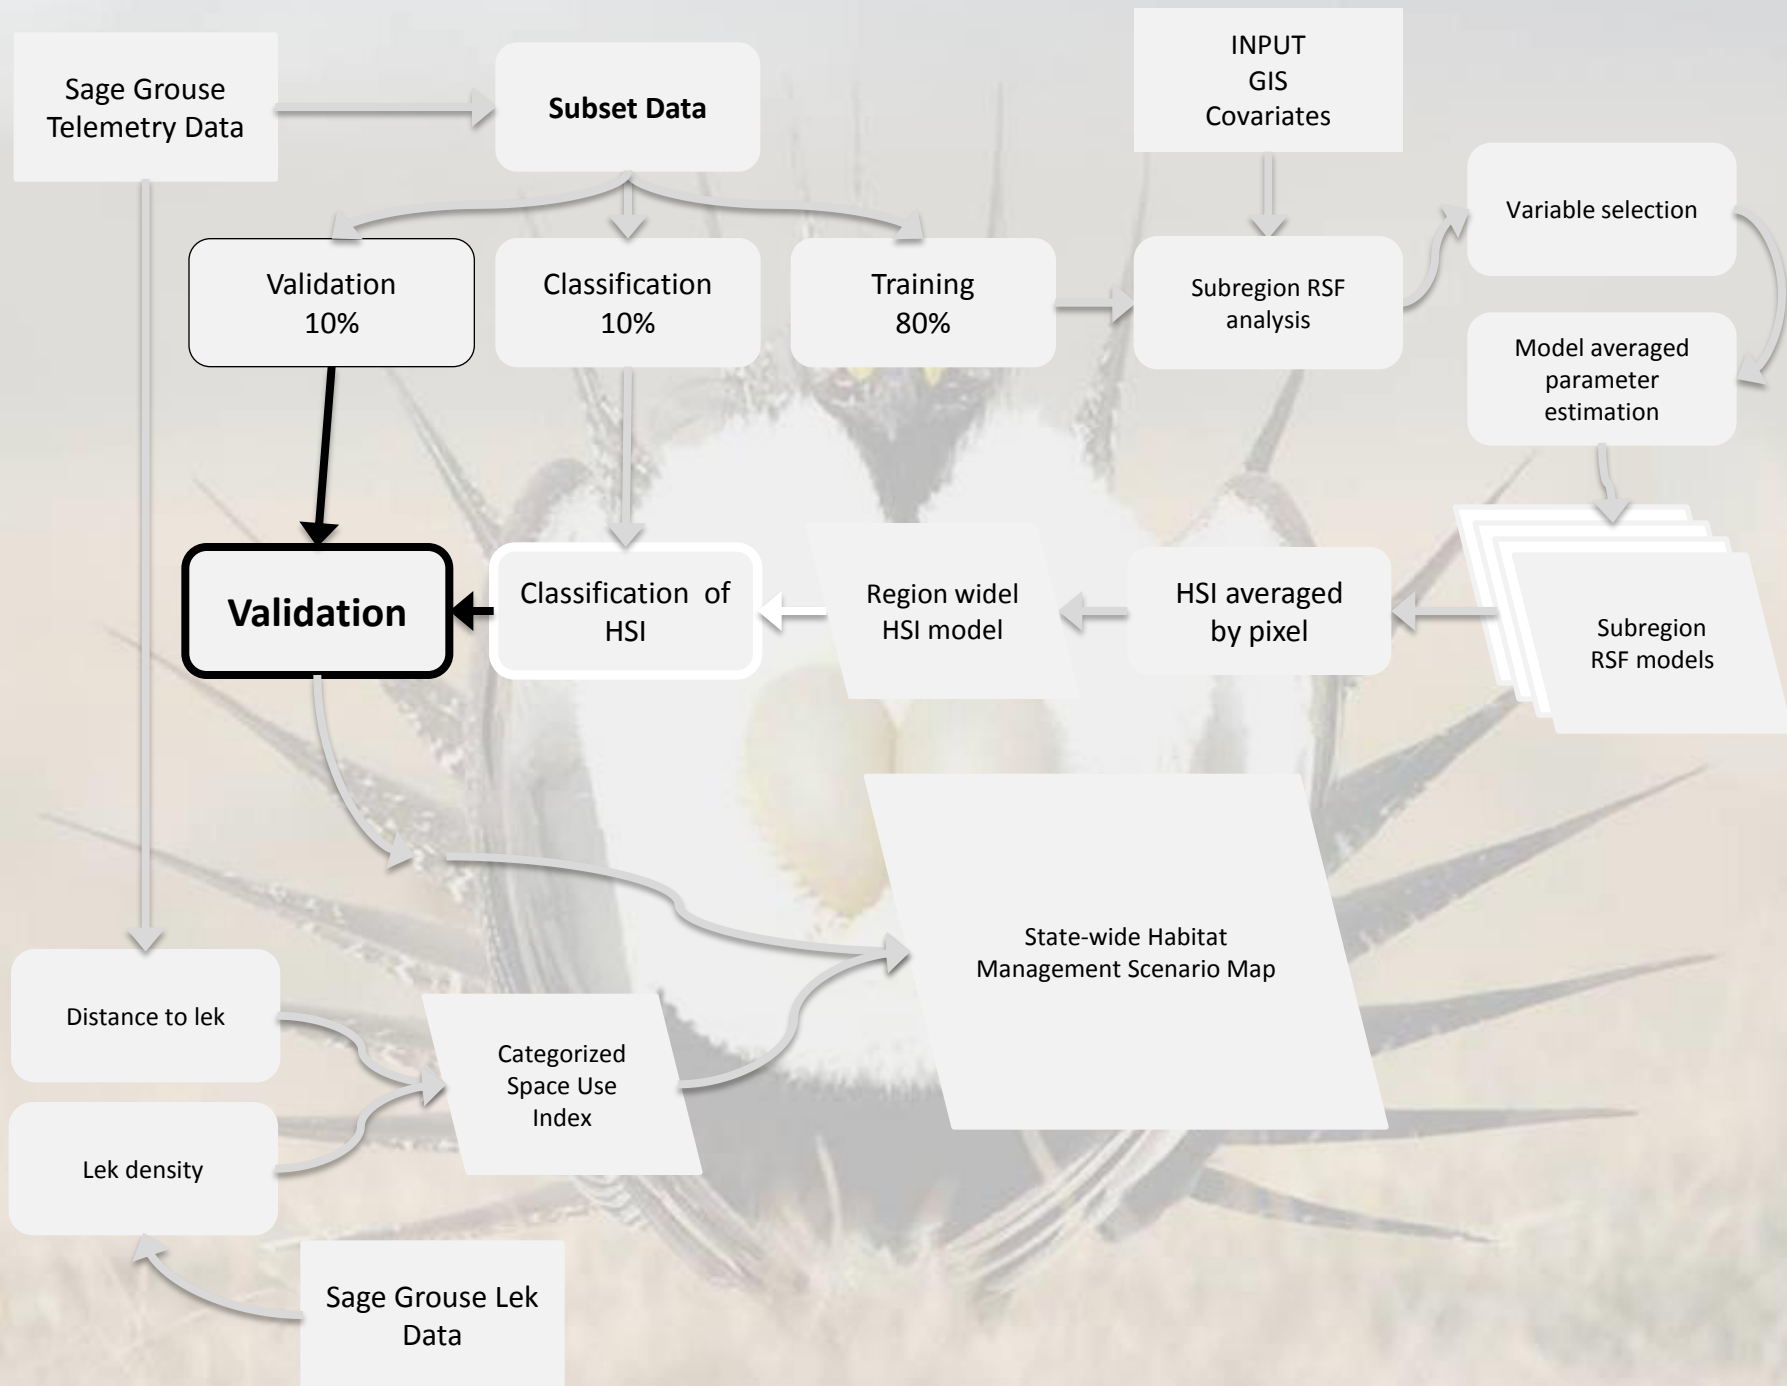

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

Habitat Suitability Areas

	<u>Acres</u>	<u>Acre Change</u> <u>2014 Map</u>	<u>%</u> <u>Change</u>
All Habitat	27,046,301	1,623,267	6%

Accounting for Known Occupancy of Lek Sites Sage-Grouse

Average 5-year lek counts

Example Lek Density Index Estimator

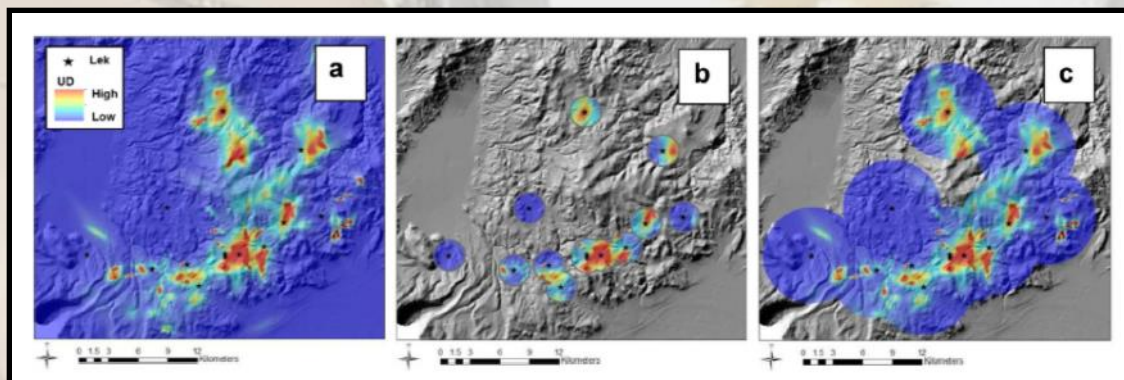

- *Kernel Estimator*

- *Weighted by 5
year count*

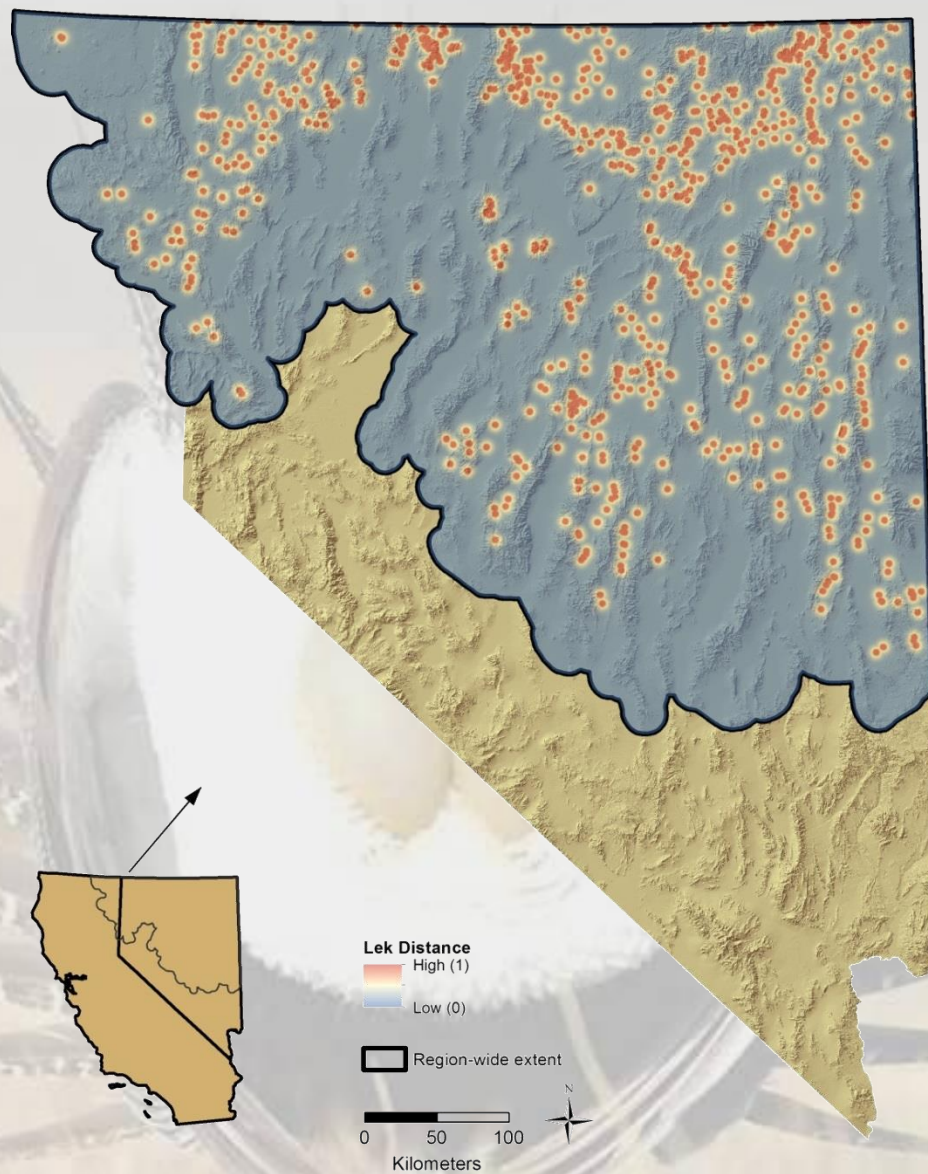

- *CVh smoothing*

Coates et al. 2013. JWM 77:1598–1609.

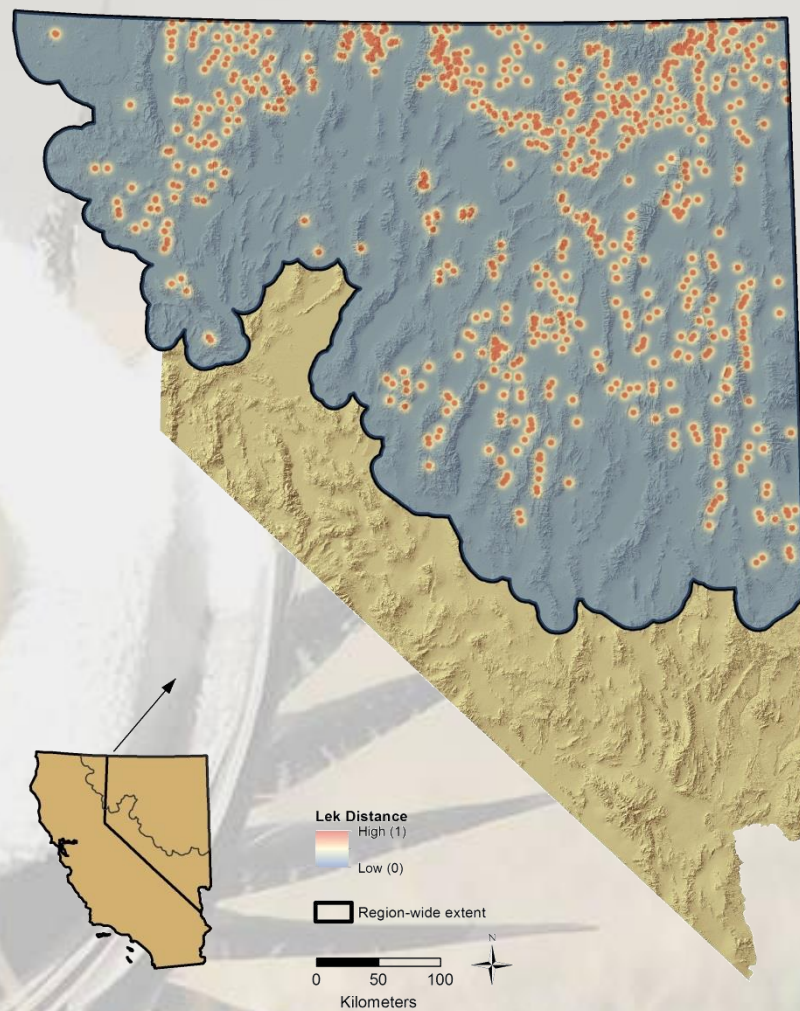

Example Distance to Lek

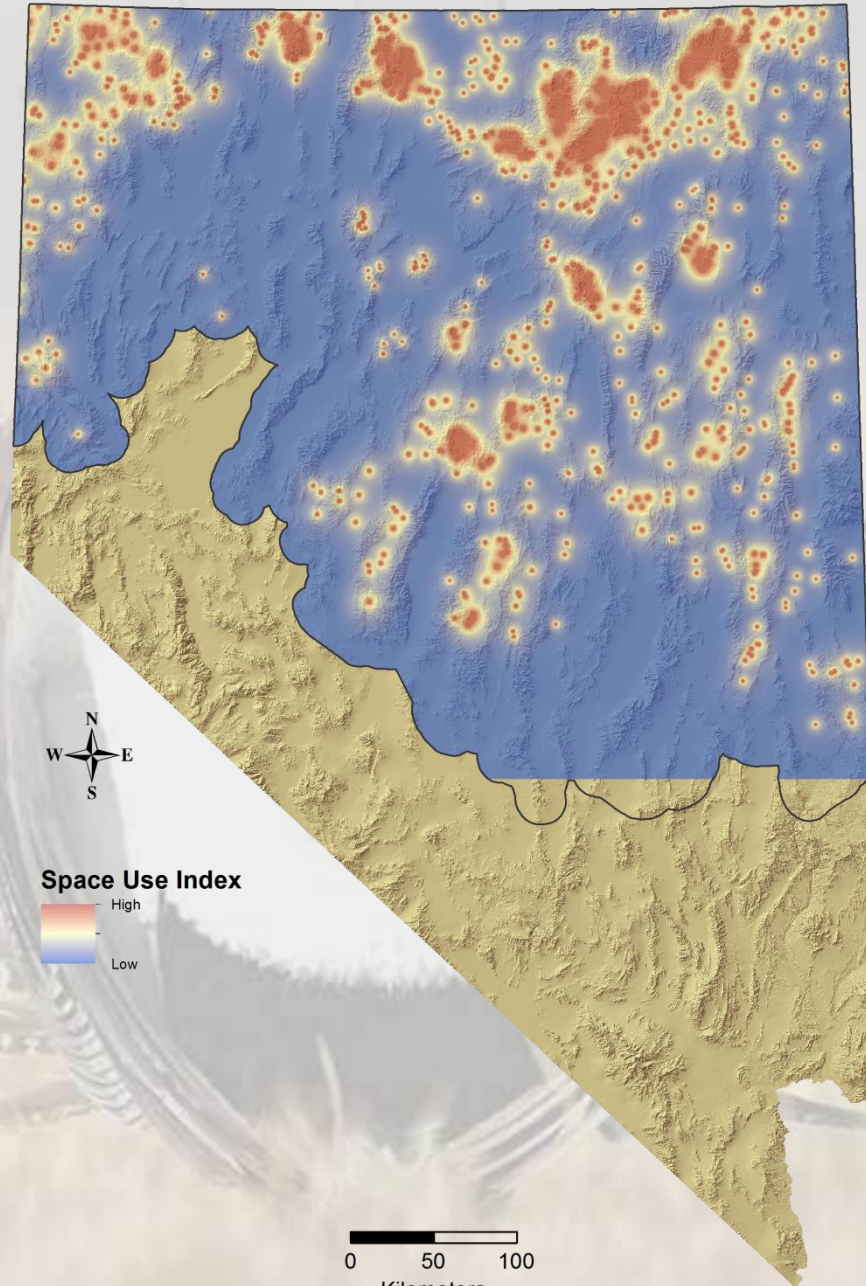

Density Index

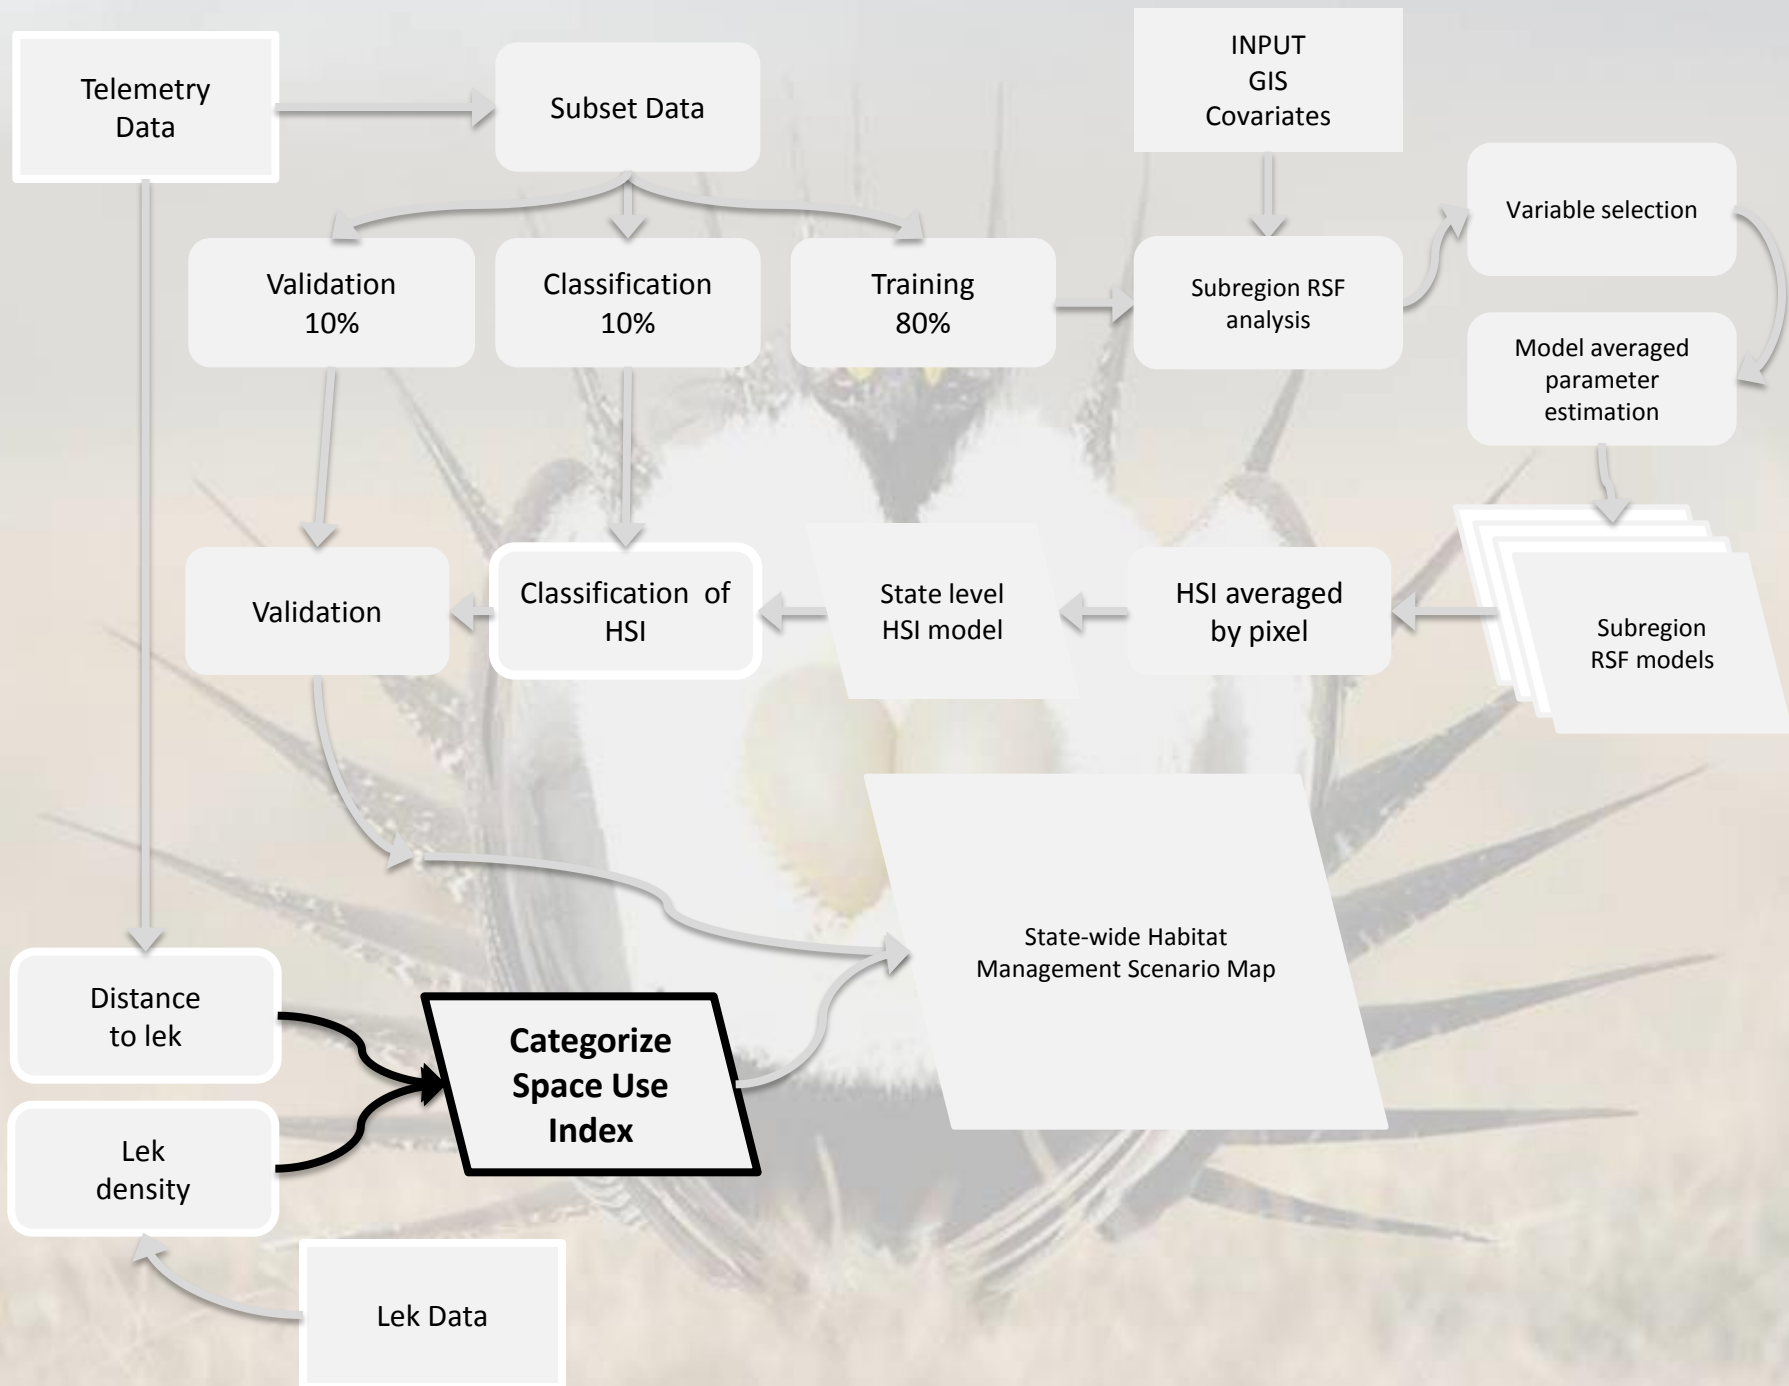

Distance Index

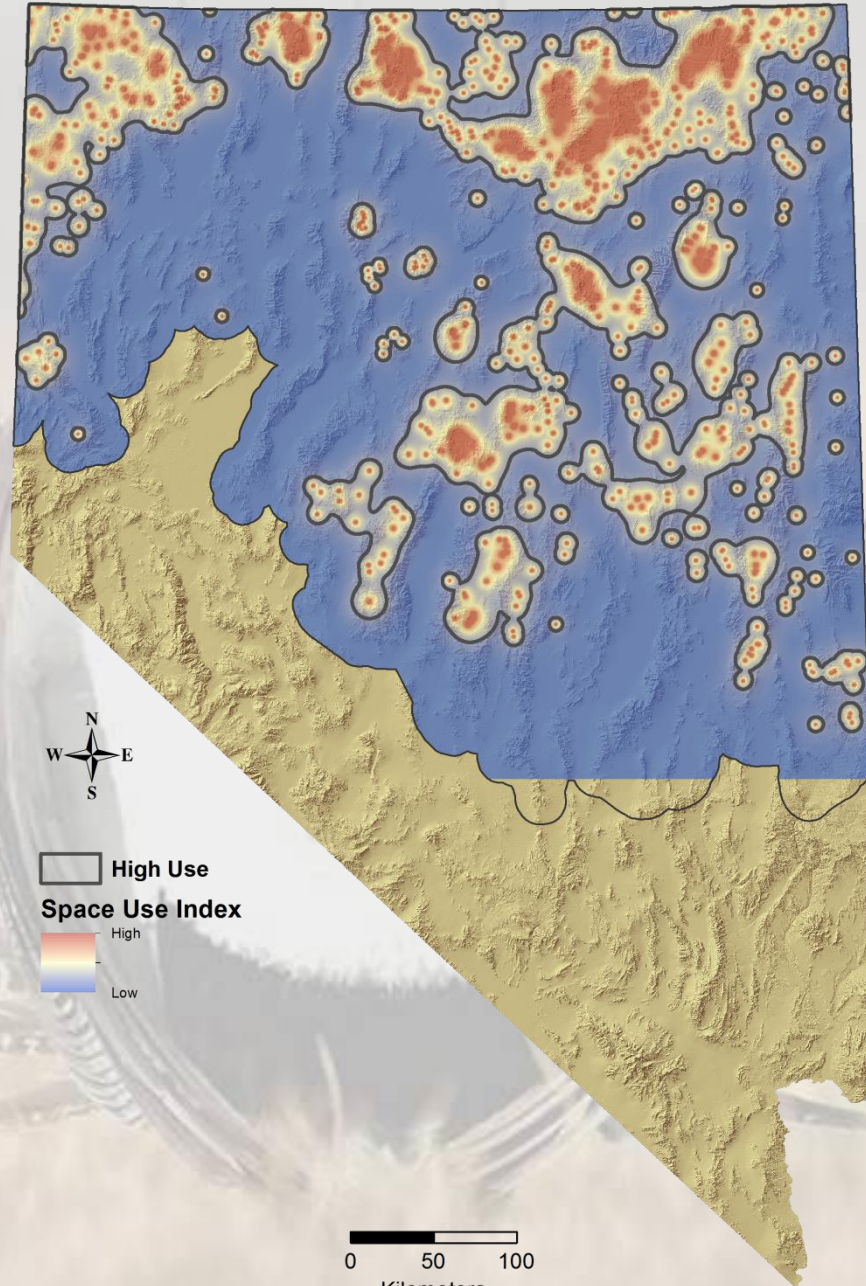

Space Use Index (SUI)

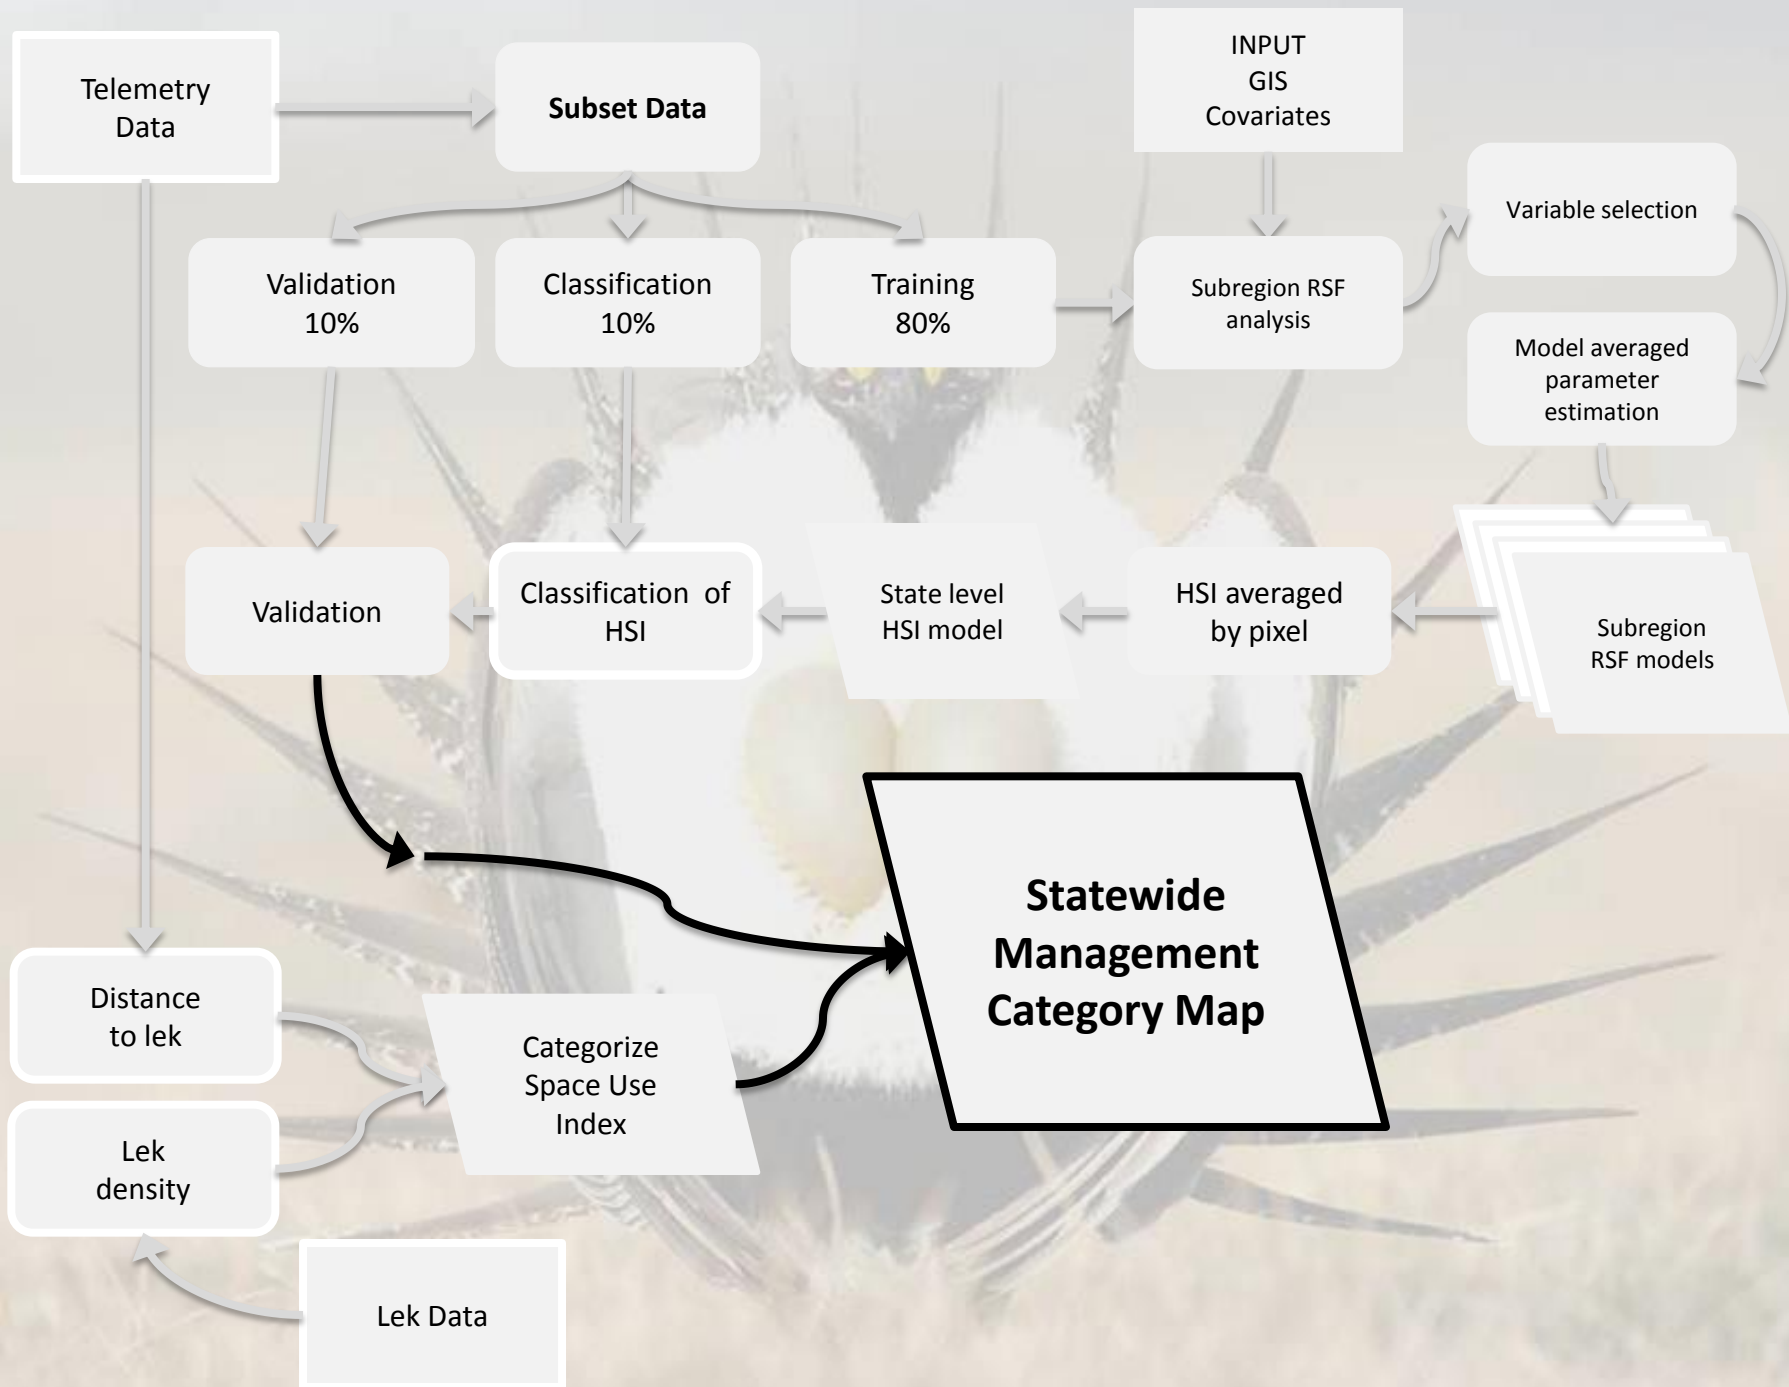

- Product of lek density, sage-grouse abundance, and distance to lek
- Use the 85% percentile to delineate 'high use'

Space Use Index (SUI)

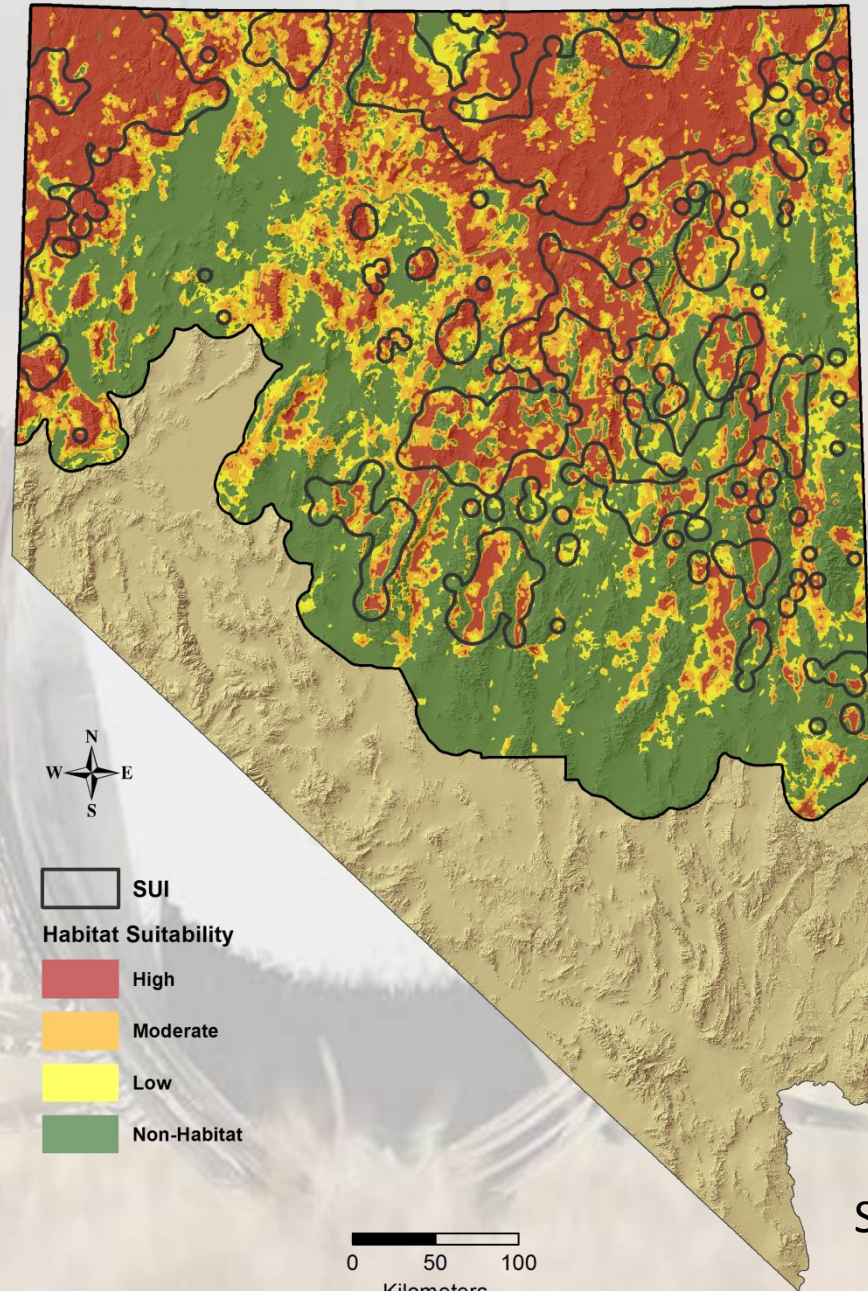

- Product of lek density, sage-grouse abundance, and distance to lek
- Use the 85% percentile to delineate 'high use'

SUI (use and abundance) intersected with HSI (habitat)

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

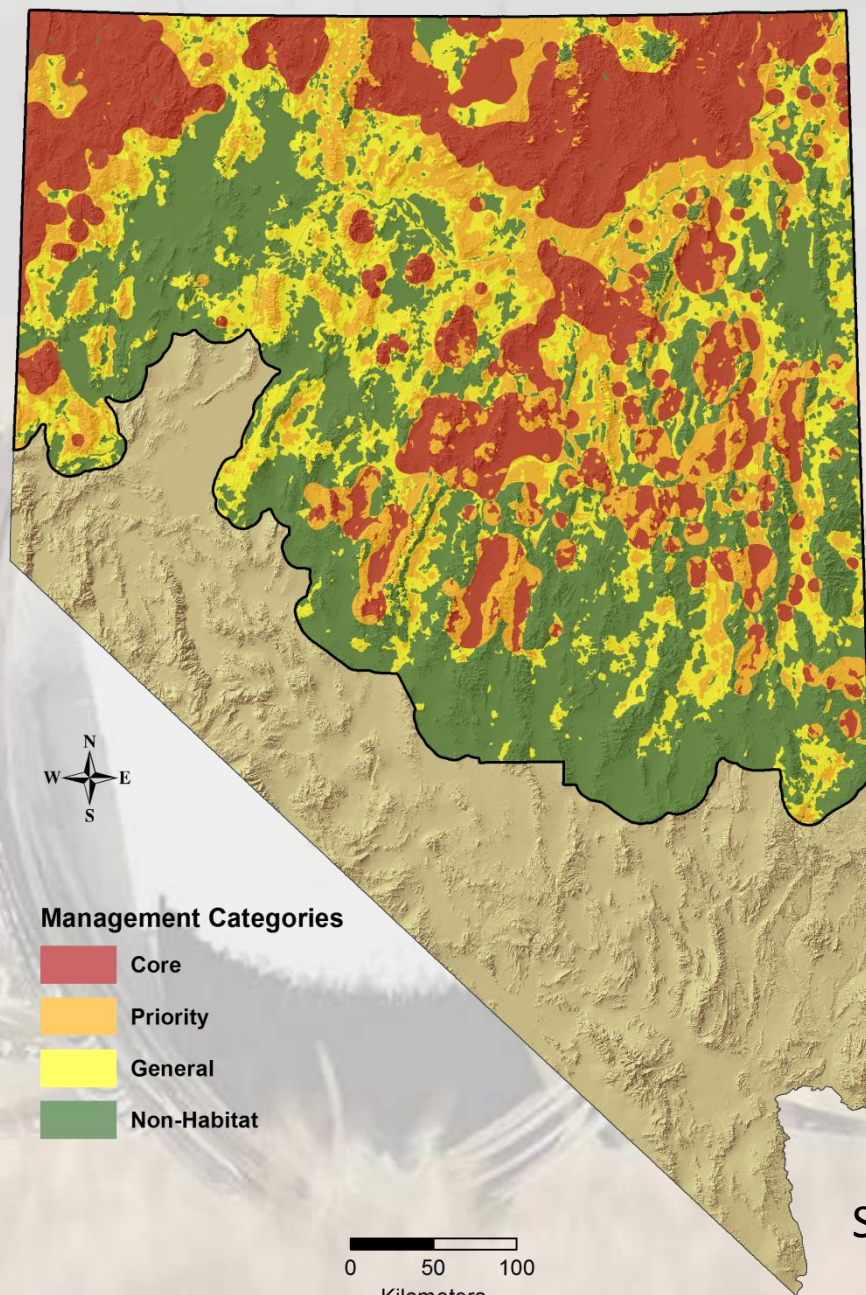

Management Categories

Core

All habitats intersect the space use and abundance

Represents conducive conditions with sage-grouse use

- Management categories based on intersection of habitat suitability and space use

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

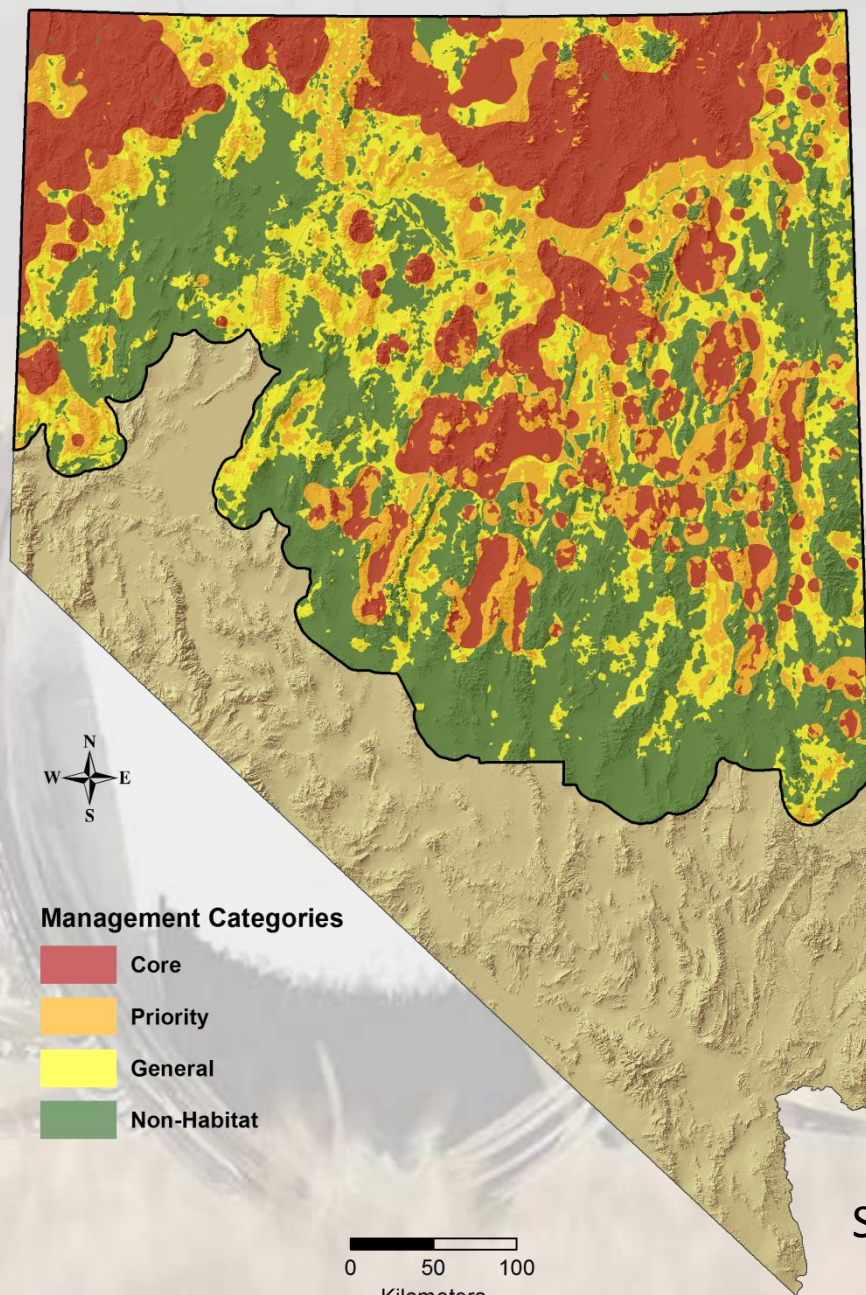

Management Categories

Priority

High quality habitat and outside of core areas

Represents conducive conditions but low sage-grouse use

- Management categories based on intersection of habitat suitability and space use

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

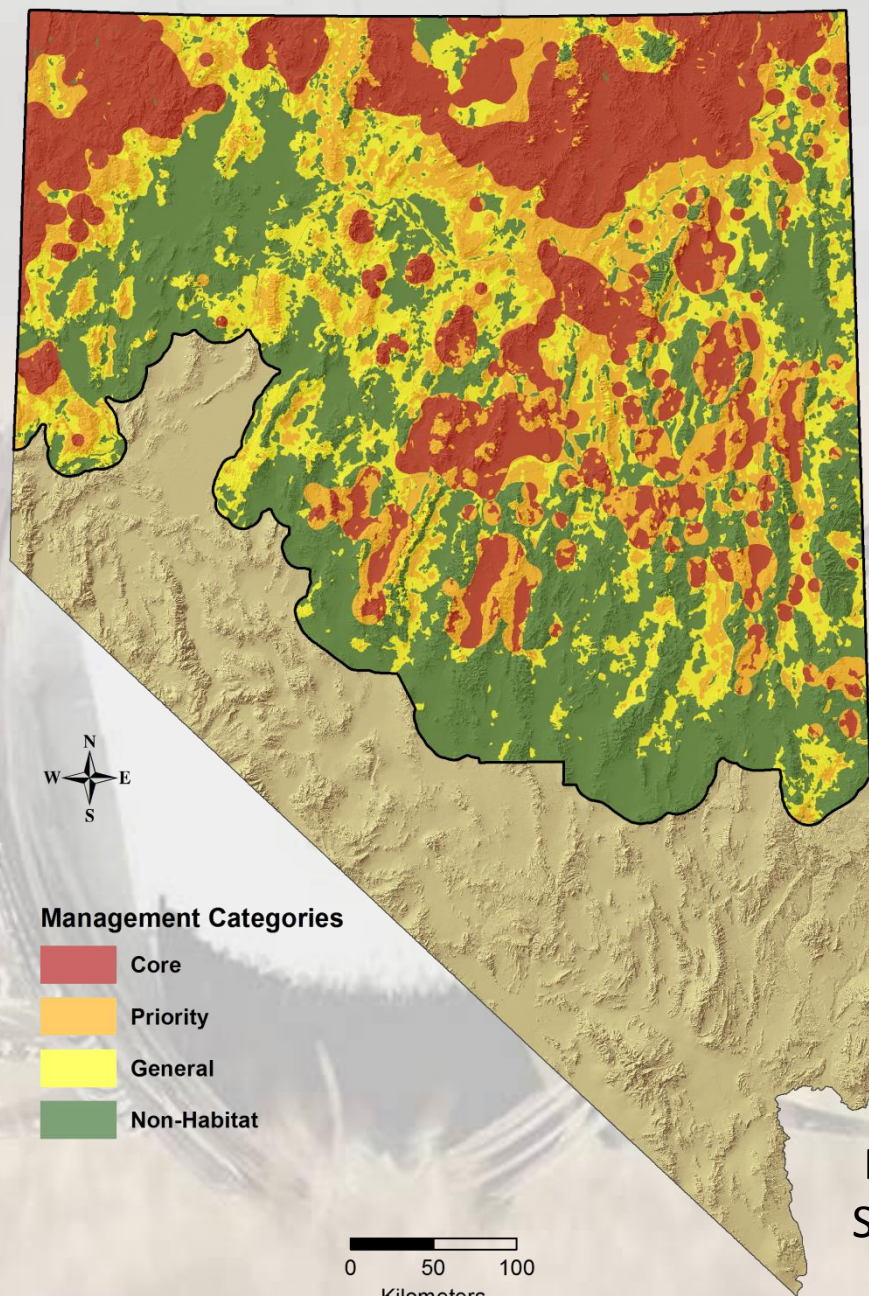

Management Categories

General

Low and Moderate habitat and outside of core areas

Represents lower quality conditions and low sage-grouse use

- Management categories based on intersection of habitat suitability and space use

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

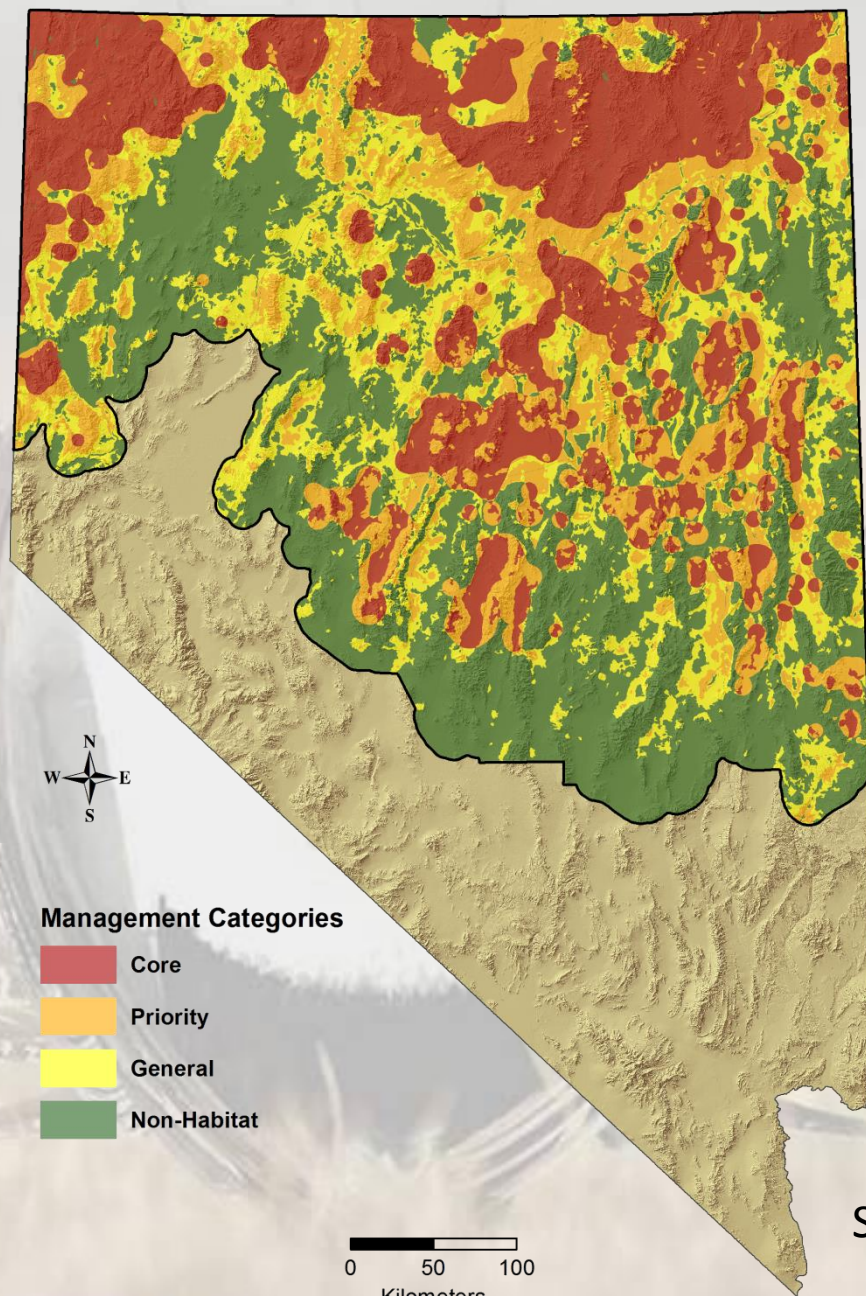

Management Categories

Non-habitat

Non-habitat
and outside of
core areas

Represents
poor
conditions and
low sage-
grouse use

- Management categories based on intersection of habitat suitability and space use

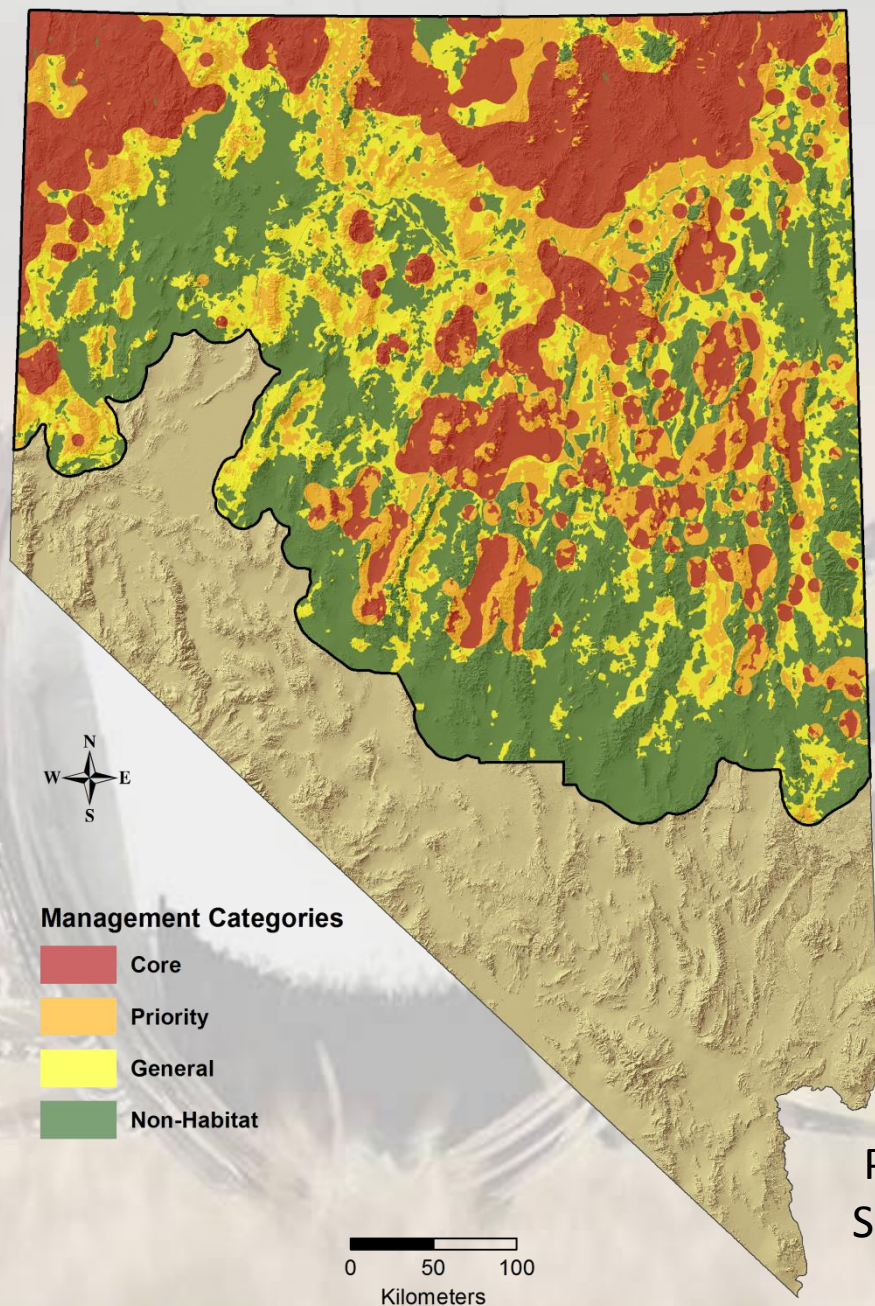

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

Management Categories

<u>Category</u>	<u>% Change from Coates et al. 2014</u>
Core and Priority	~6.5%
All Mang.	8%

- Management categories based on intersection of habitat suitability and space use

Preliminary Information—
Subject to Revision. Not for
Citation or Distribution

Example Improvement (Conifer Areas)

Example Improvement (Conifer Areas)

Example Improvement (Conifer Areas)

Previous version
released in 2014

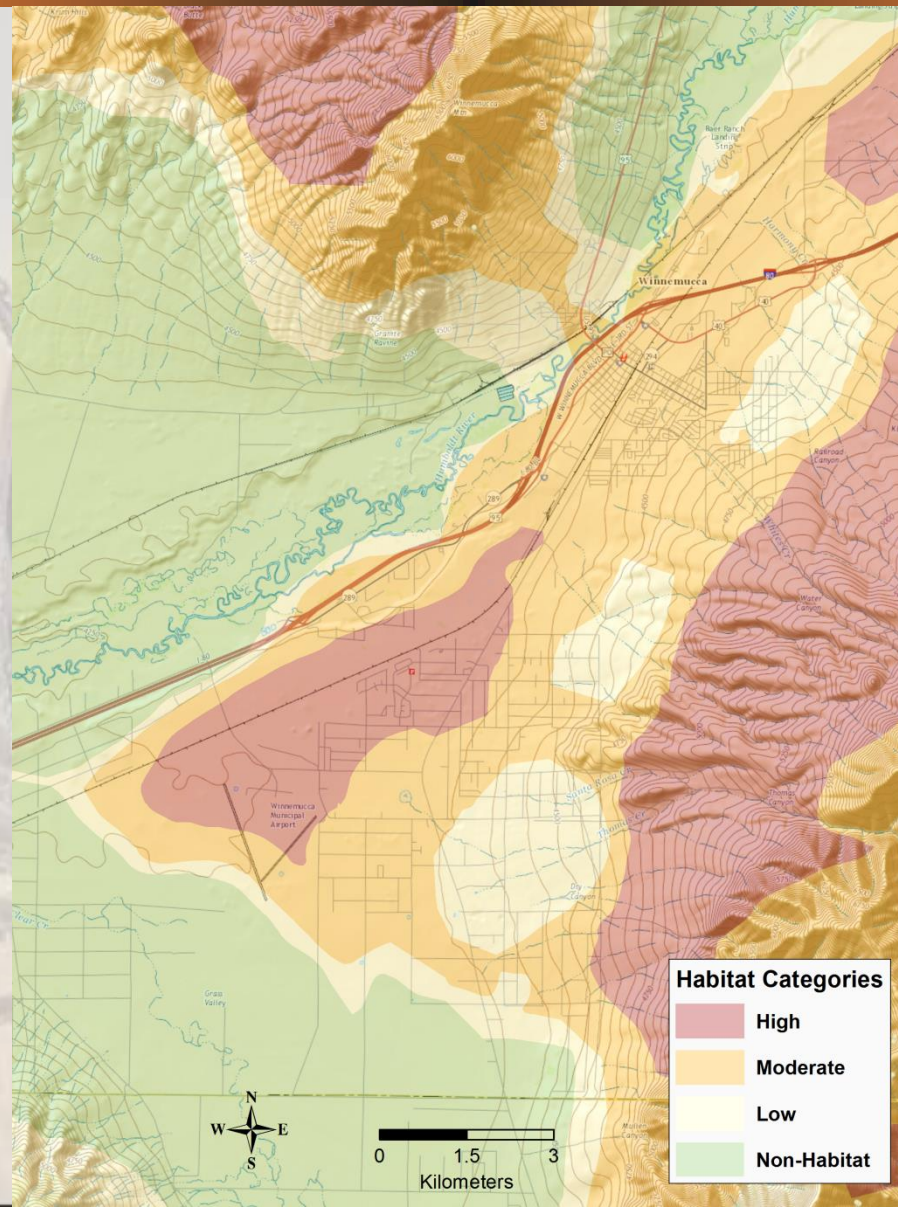

Example Improvement (Conifer Areas)

Updated version

Example Improvement (Urban Areas)

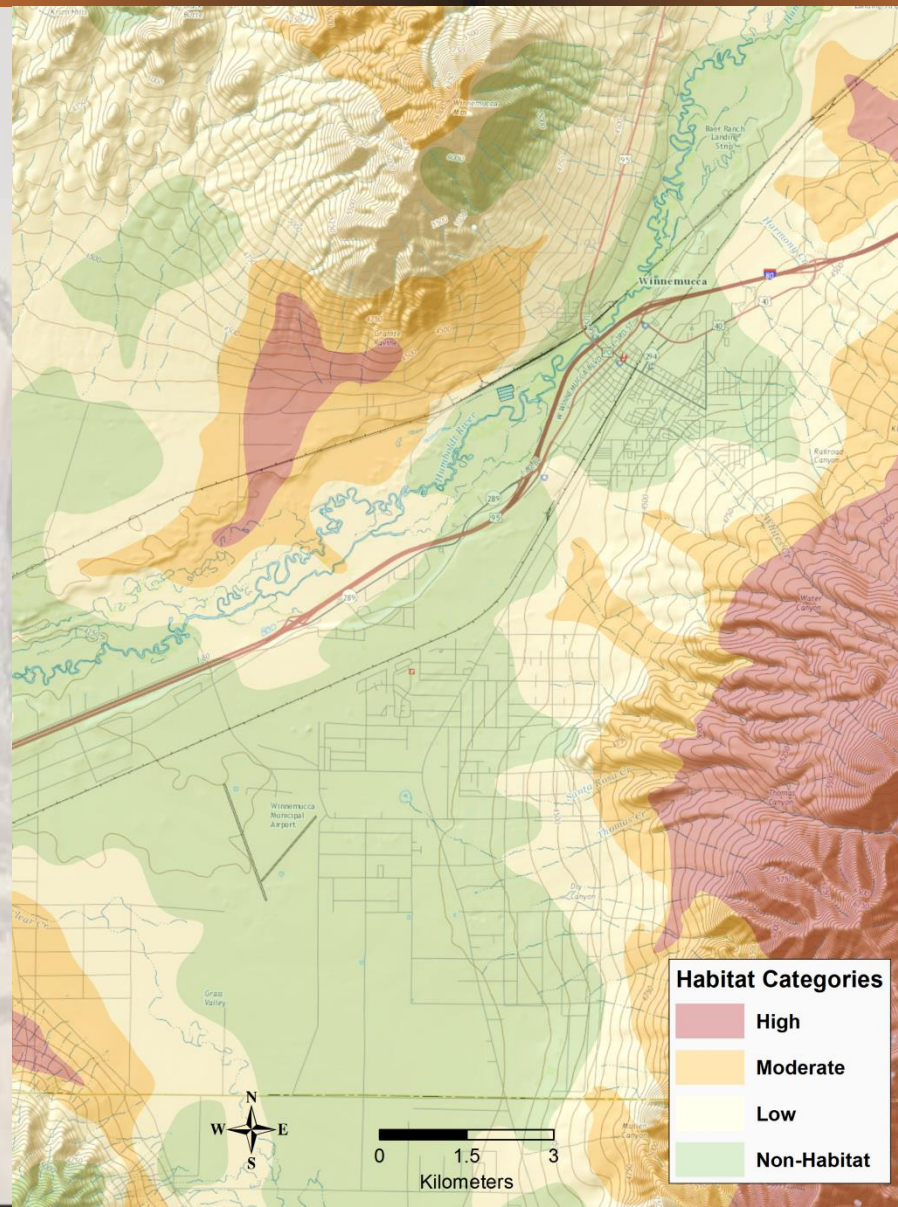

**Previous version
released in 2014**

Annual Map from
2014 showing
habitat categorized
within
Winnemucca.

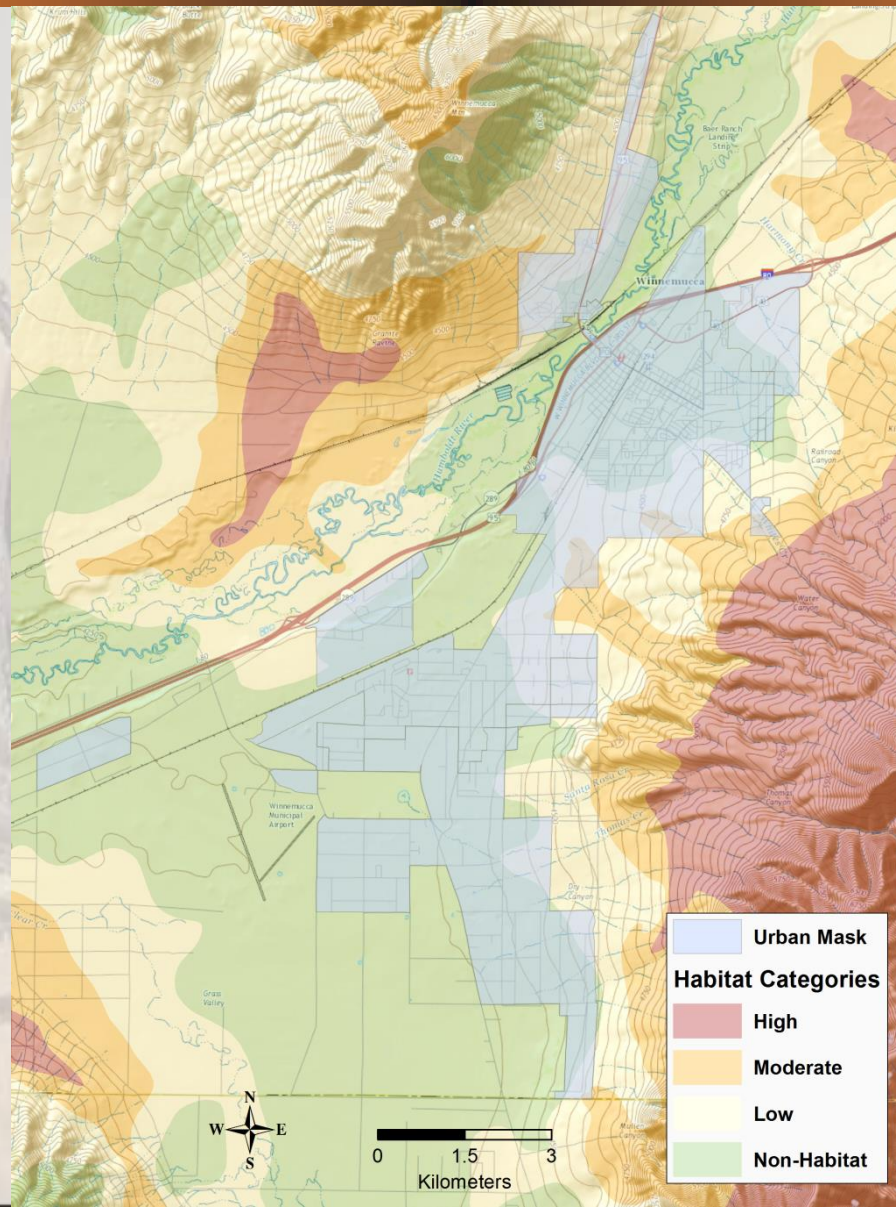

Example Improvement (Urban Areas)

Updated version

With improvements to model urban areas are non-habitat

Example Improvement (Urban Areas)

- Urban areas were further masked with best available GIS census data
- Some surface disturbances may not be masked – limitation of available data

Summary Points for Updated Map

- High resolution (< 2 m) inputs for land cover types most relevant to sage-grouse (2014 map based on 30-m resolution)

Big-sagebrush, low-sagebrush, non-sage shrub, bare ground, herbaceous interspace, pinyon-juniper, and pinyon-juniper understory

- Seasonal maps: 24 season by sub-regional RSF combinations (2014 map had 12 sub-regional RSFs)
- Updated with 2014 telemetry and lek count data
- Urban areas 'masked out'
- Improvement in accuracy assessment using validation process (~2%)
