

Prioritizing Conifer Removal Treatments to Optimize Greater Sage-grouse Habitat Benefits across the Great Basin

Justin Small

Wildlife Staff Specialist – NDOW Representative SETT

Sagebrush Ecosystem Program

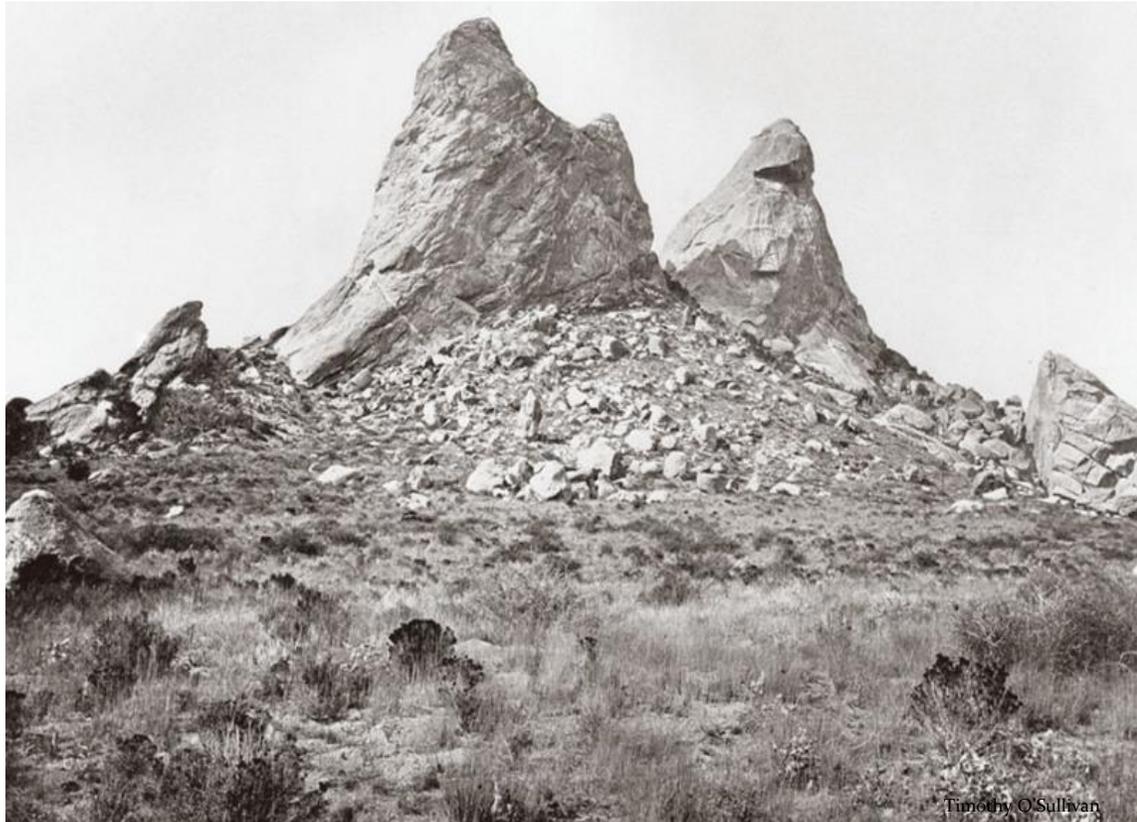

Outline

- Greater Sage-grouse Response to Conifer Removal Efforts in Northwestern Utah
 - Introduction to Conifer Expansion
 - Section 1: Forecasting Vegetation Composition Responses to Pinyon - Juniper Treatments.
 - Section 2: Prioritizing conifer removal treatments to optimize greater sage-grouse habitat benefits.
- Prioritization Tool: How it works

Conifer Expansion

Utah State Plan 2013

Conifer Encroachment

Credit: USDA-NRCS, Working Lands for Wildlife

Conifers & Sage-grouse

- Encroachment
 - Suppressed understory
 - Xeric climate
 - Predator nest/perch sites
 - Lek extirpation
 - Displacement
- Removal
 - Use
 - ...

Reasons for conifer expansion:

- Human modifications of native habitat
- Invasive plants
- Shifts in natural fire cycles
- Climate change

Human modifications of native habitat

Invasive Annuals

Nolan E. Preece

Shifts in natural fire cycles

Natural Historic Cycle

Grasses and forbs dominate

Grasses, forbs, and shrubs

Sagebrush dominates

Cheatgrass/Fire Cycle

Cheatgrass dominates

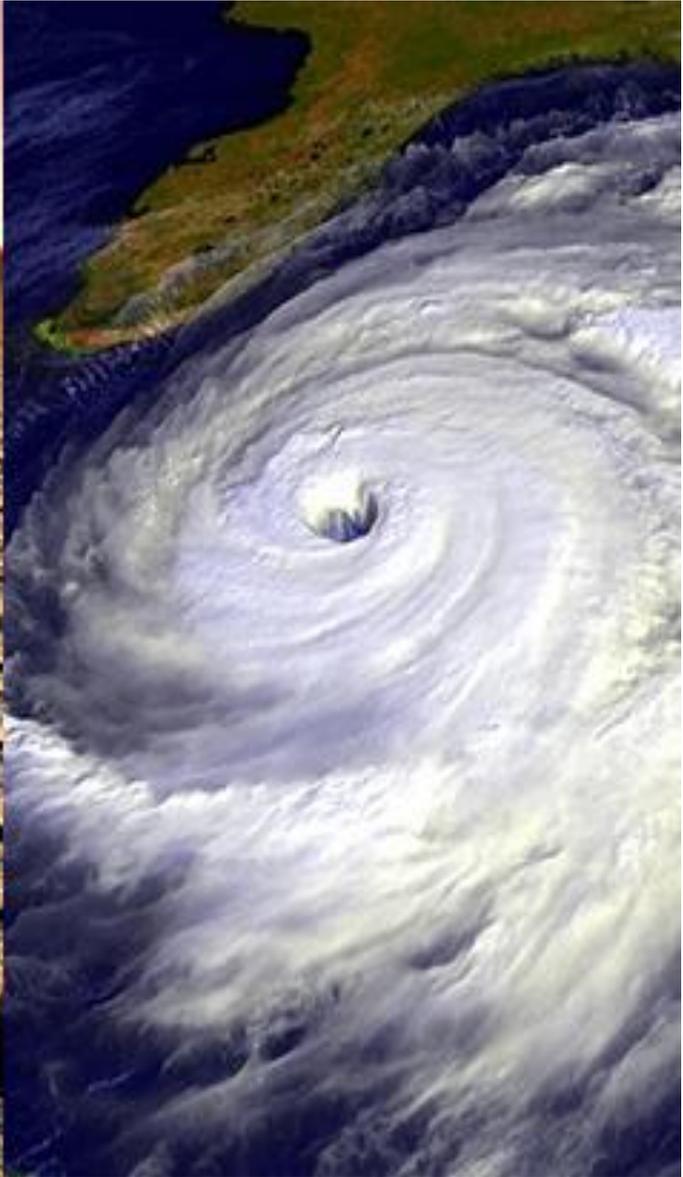

Frequent Fire

Climate Change

Why is sage-grouse response to treatments important?

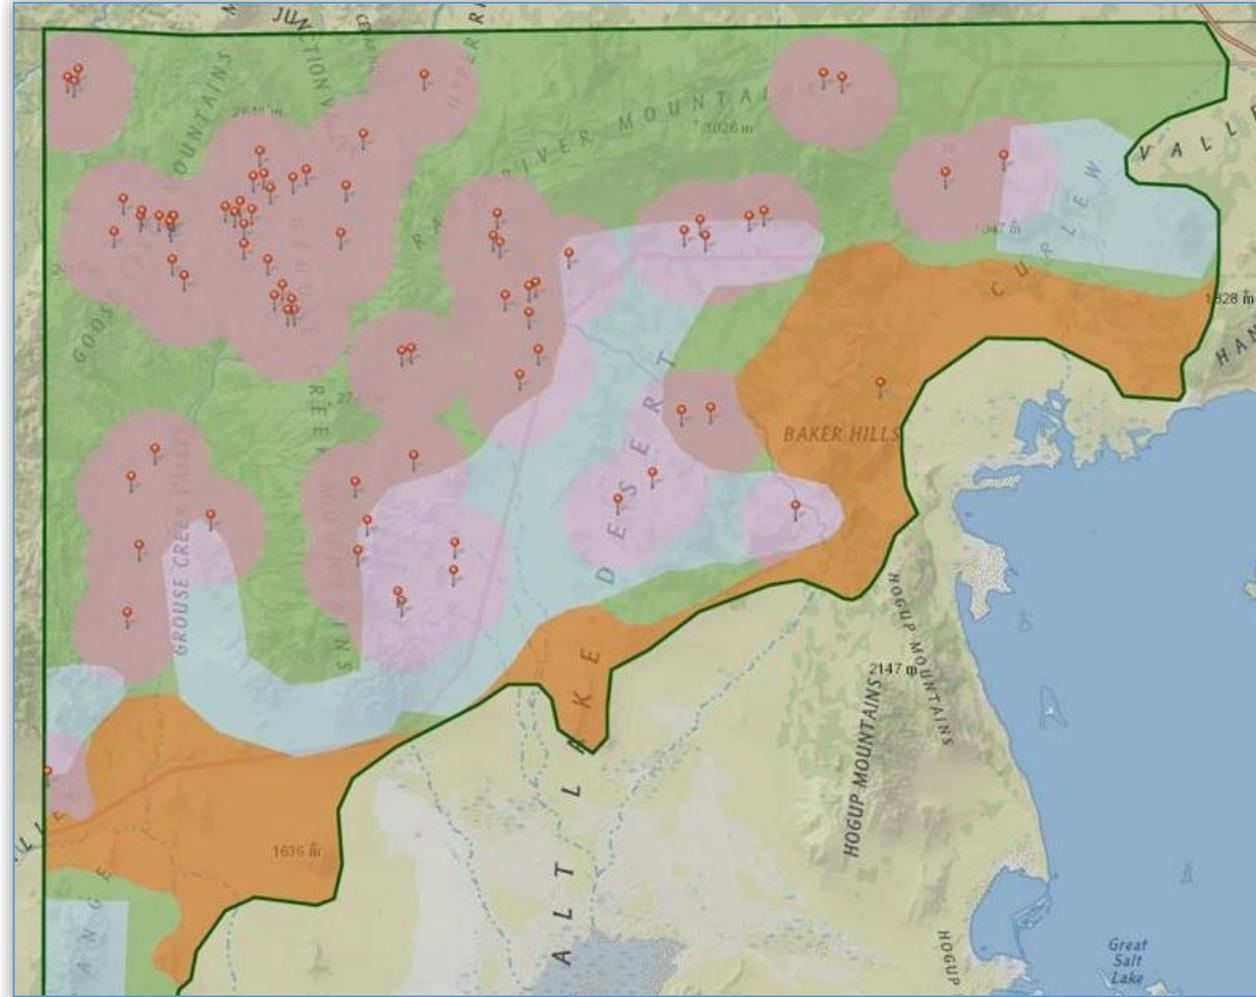

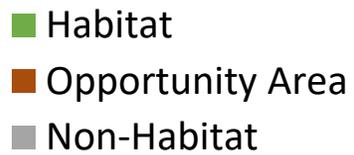

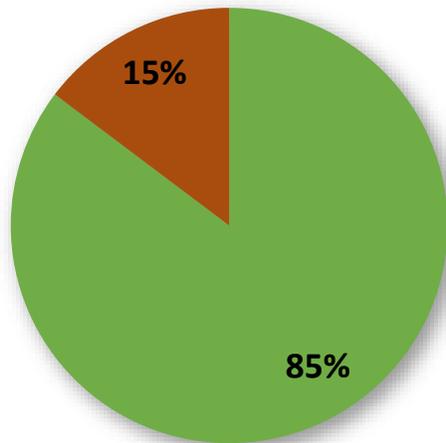

- Management implications for agencies and landowners within the SMGA
- Critical to demonstrate proper mitigation techniques were used.
- Are treatments worth the time and money?

Objectives

- Develop a prioritization model to predict vegetation composition response to pinyon-juniper treatment.
- Identify if sage-grouse are responding positively to pinyon-juniper removal at the scale of the landscape.
- Make the priority tool interpretable to managers and easy to apply as new treatments are planned across the landscape.

Study Area: Box Elder SGMA

Data Collection

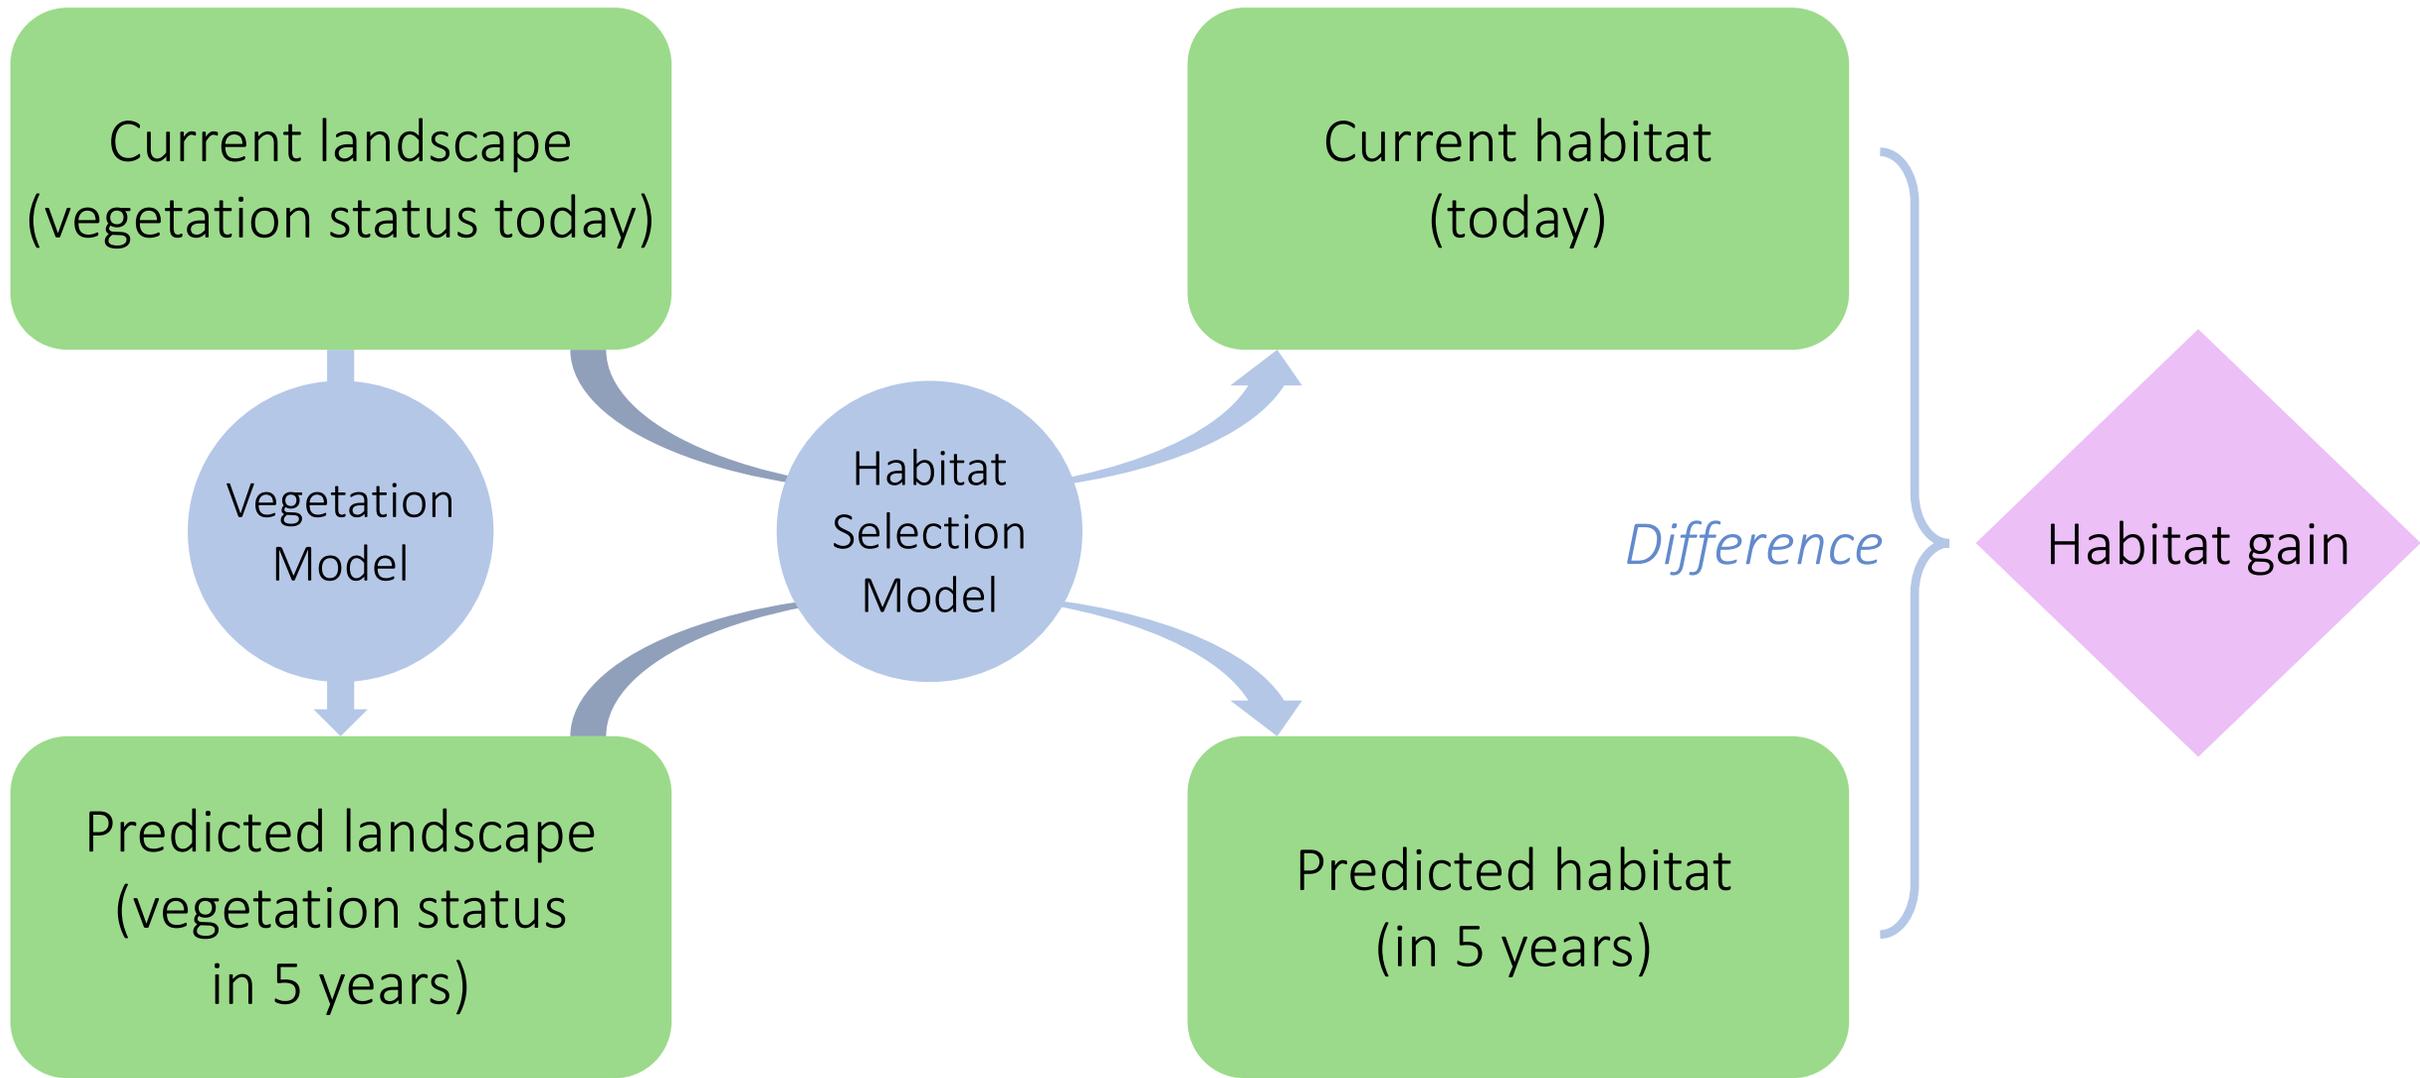

- From 2016 - 2019, we captured and marked 96 sage-grouse where fitted with GPS rump mounted transmitters and 156 VHF necklace radio transmitters

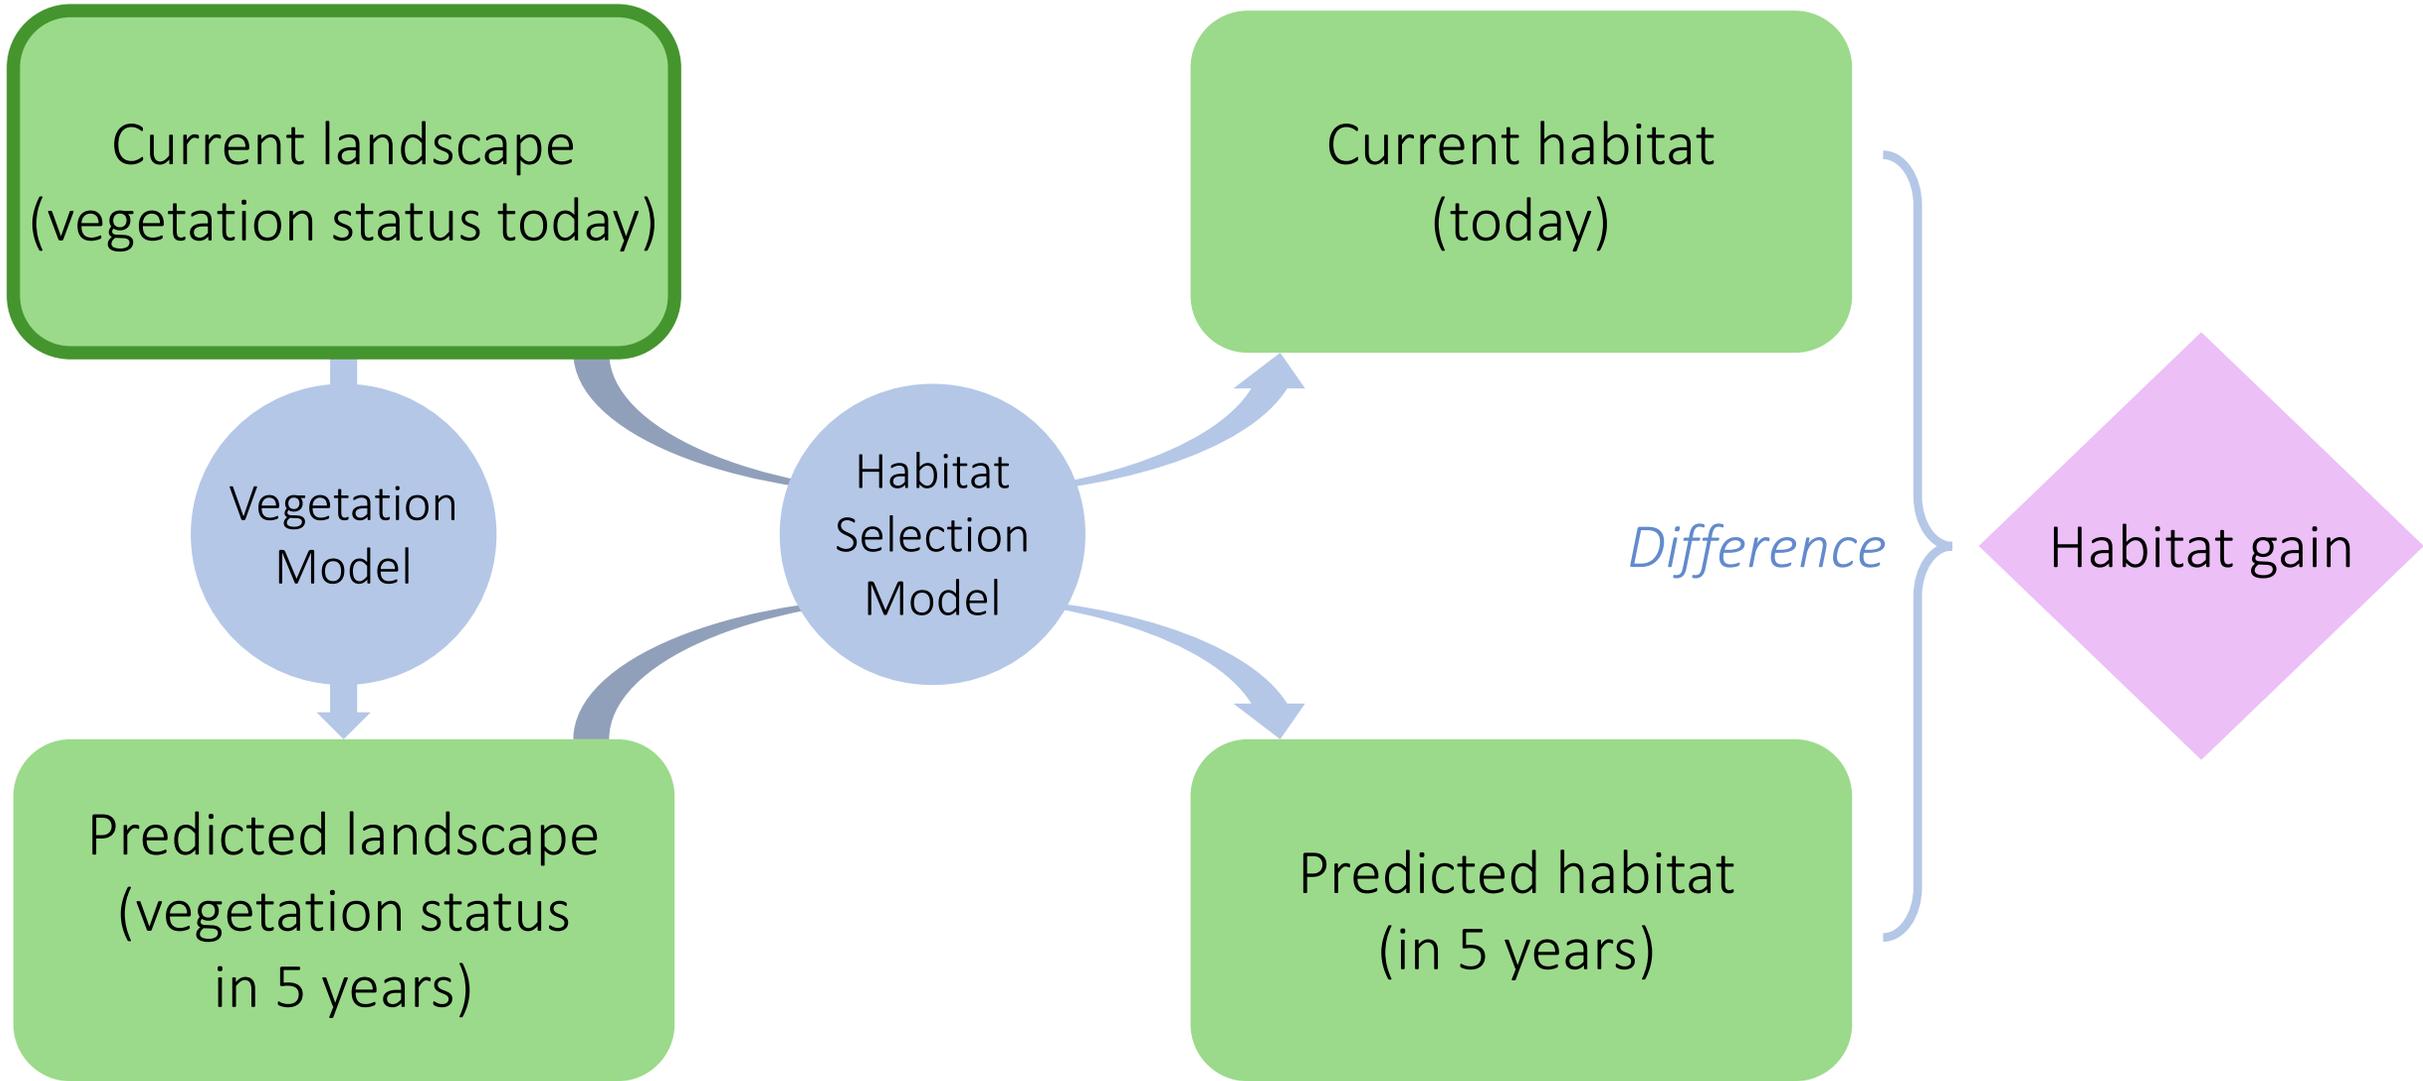

Forecasting Vegetation Composition Responses to Pinyon -
Juniper Treatments in Northwestern Utah

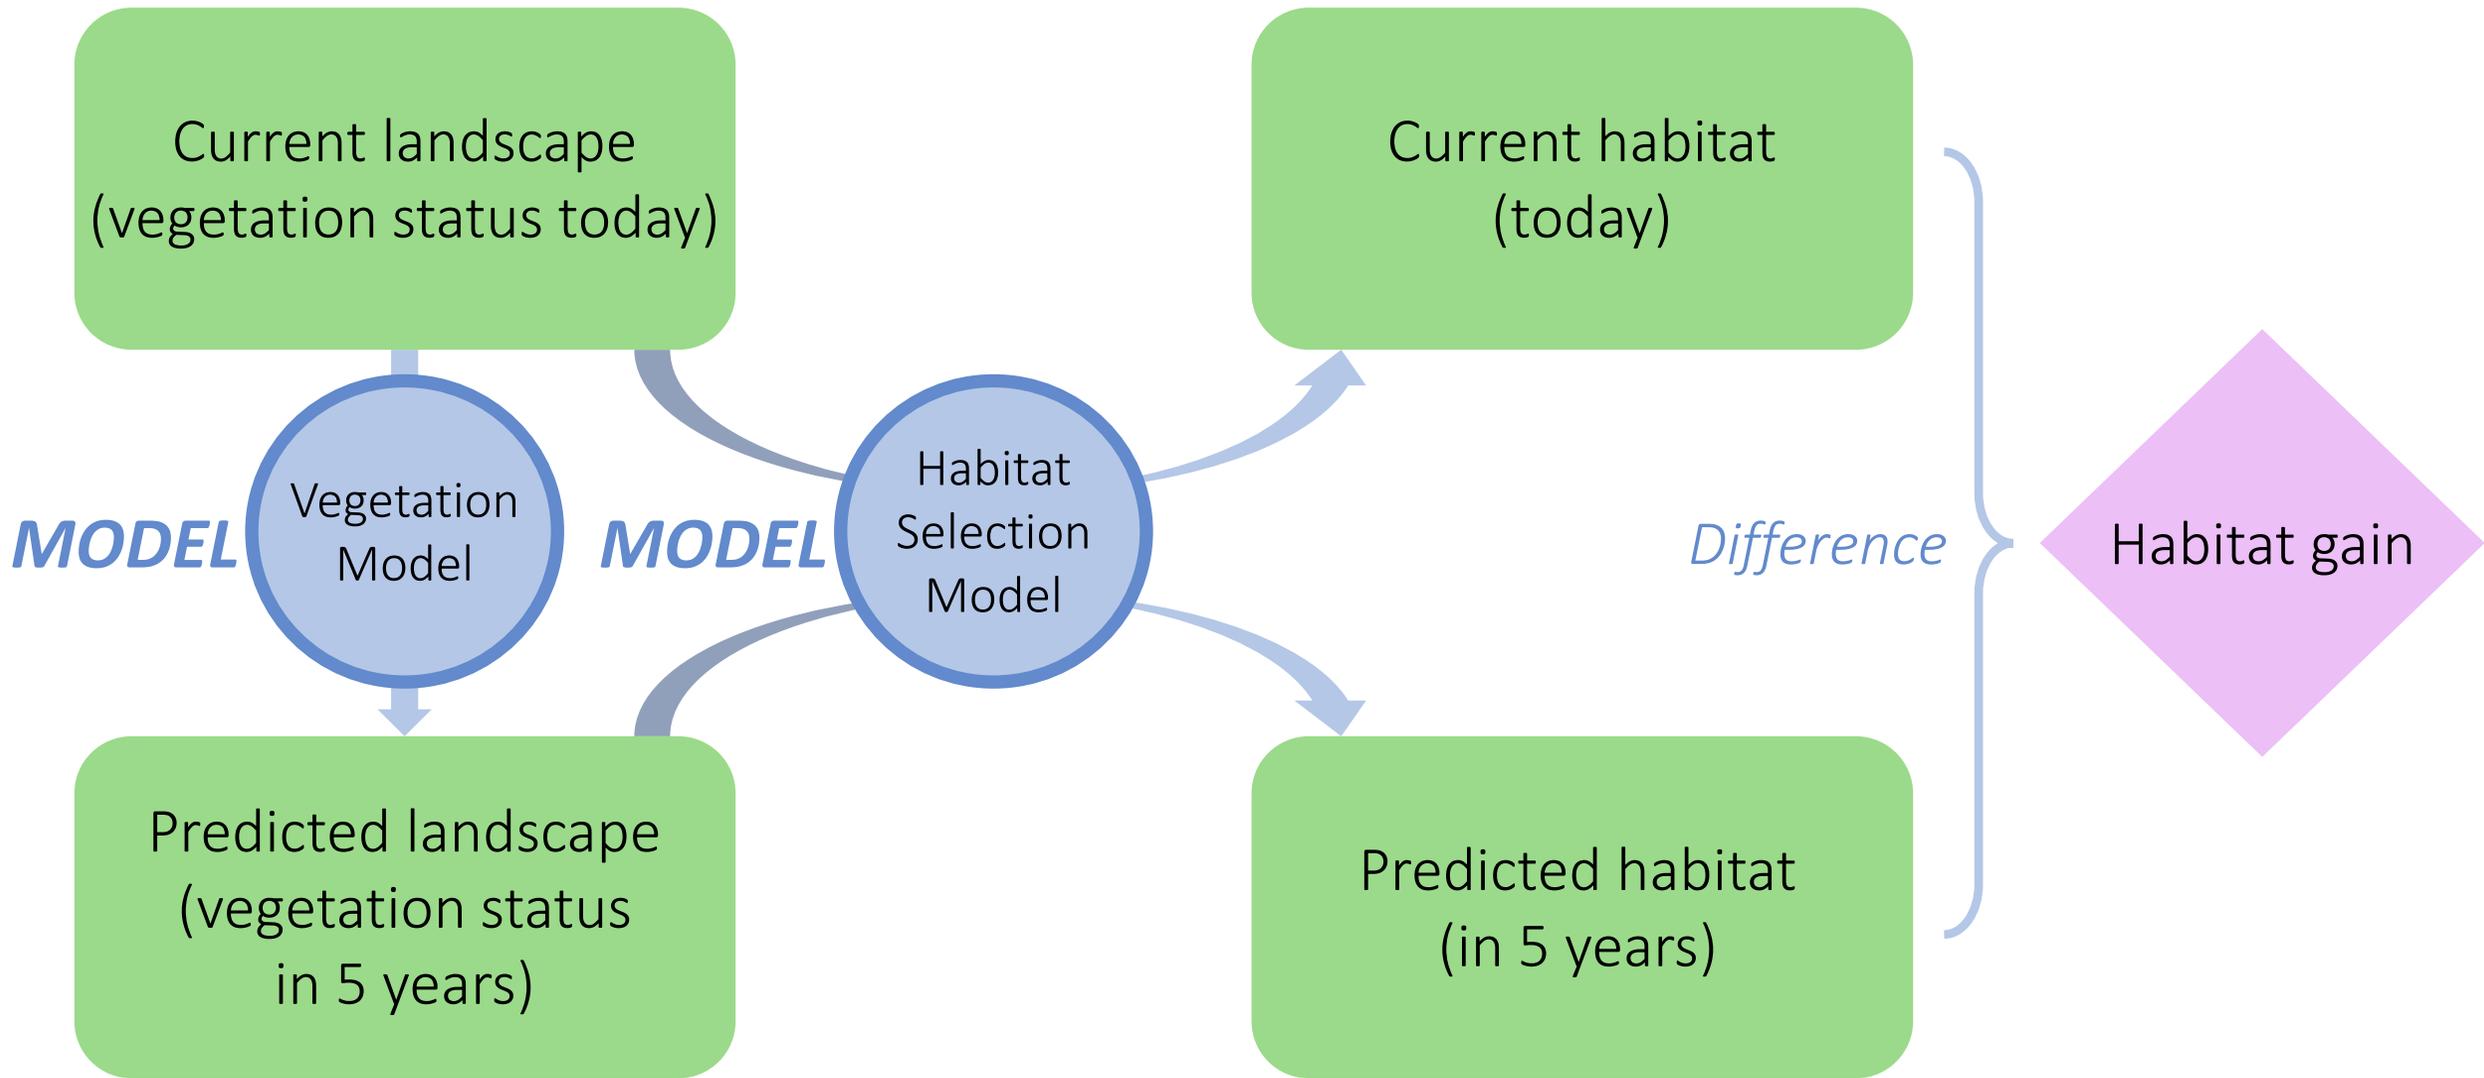

&

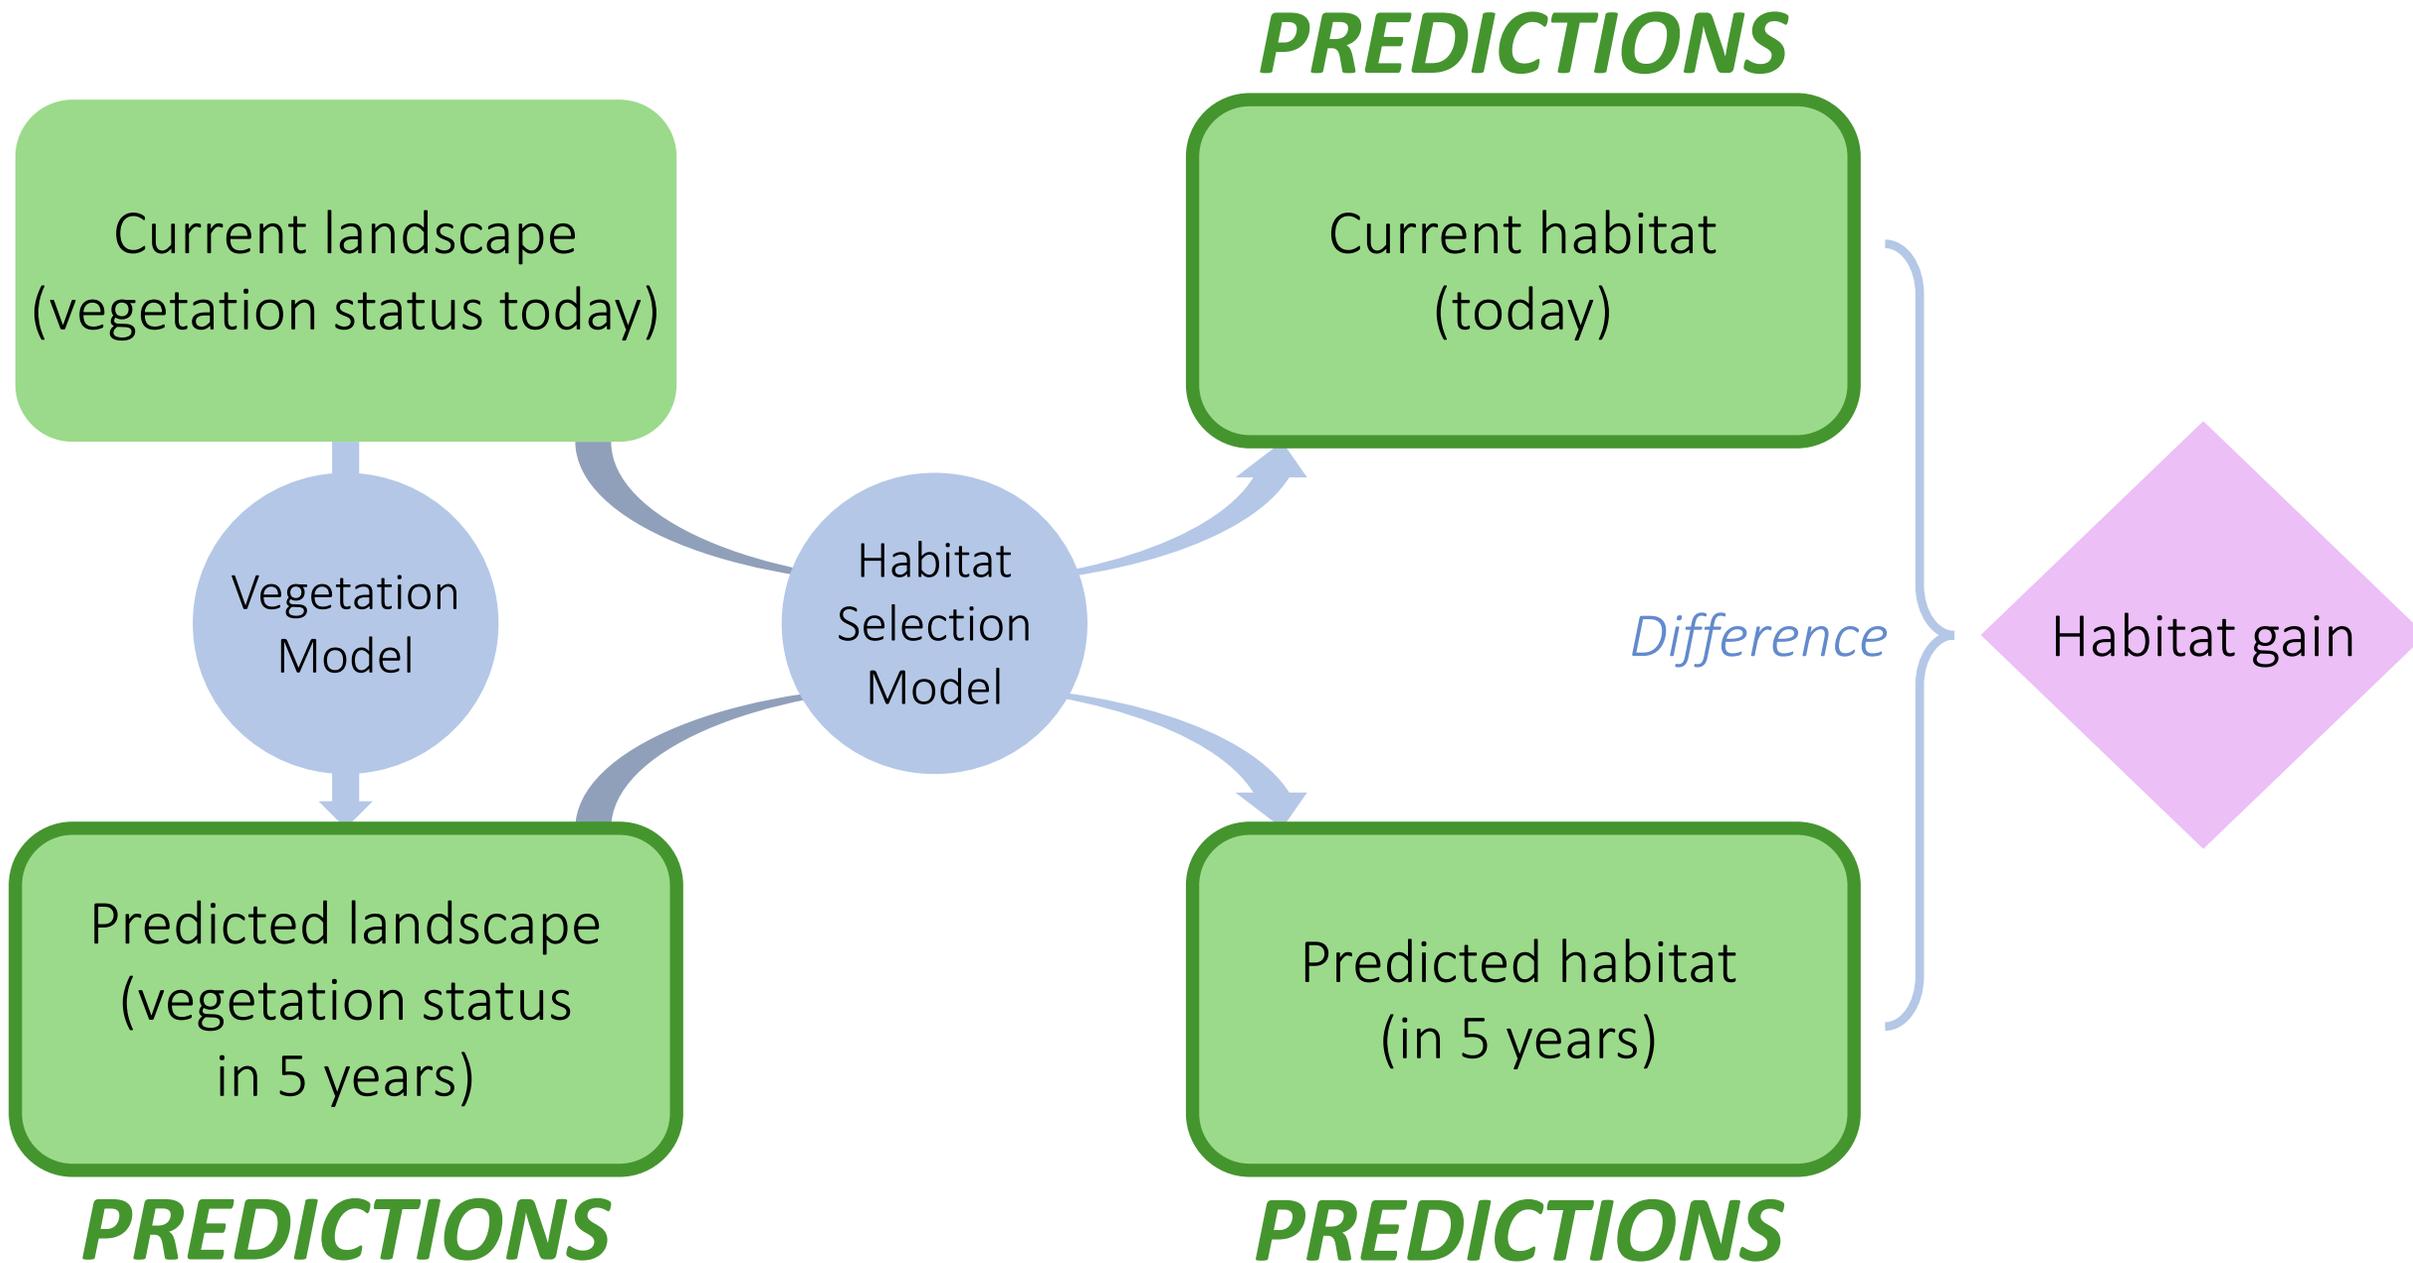

Prioritizing conifer removal treatments to optimize greater
sage-grouse habitat benefits in northwestern Utah

DATA

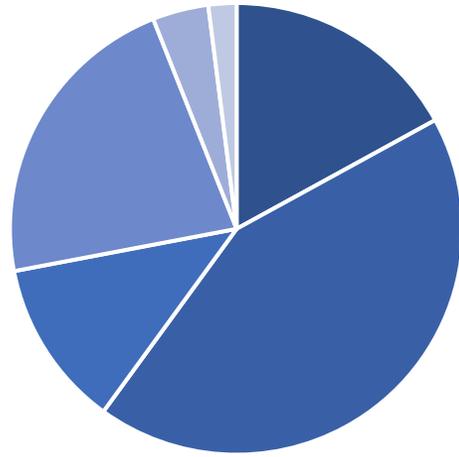

VEGETATION MODEL

Training

Training data:

- 10 WRI treatments performed between 2008 and 2014 in Box Elder county
- RAP data on vegetation composition in the year prior and 5 years after treatment
- Dirichlet regression to model the effect of treatment

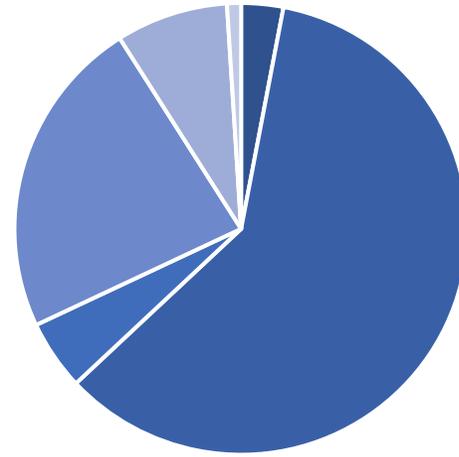

Percent Cover Prior to Treatment

- Trees
- Shrub
- Annual grasses and forbs
- Perennial grasses and forbs
- Litter
- Bare ground

Percent Cover 5 Years Post-Treatment

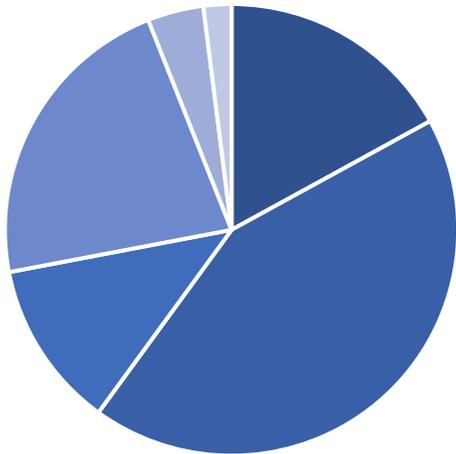

- Trees
- Shrub
- Annual grasses and forbs
- Perennial grasses and forbs
- Litter
- Bare ground

VEGETATION MODEL

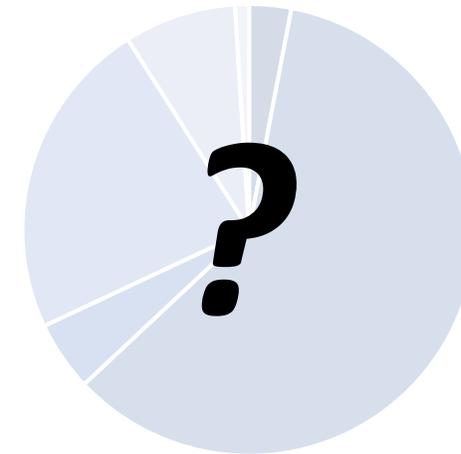

Prediction

- Treatments to compare
- RAP data on vegetation composition in the year prior to treatment
- Predict expected vegetation composition 5 years after treatment using Dirichlet model

Percent Cover Prior to Treatment

Percent Cover 5 Years Post-Treatment

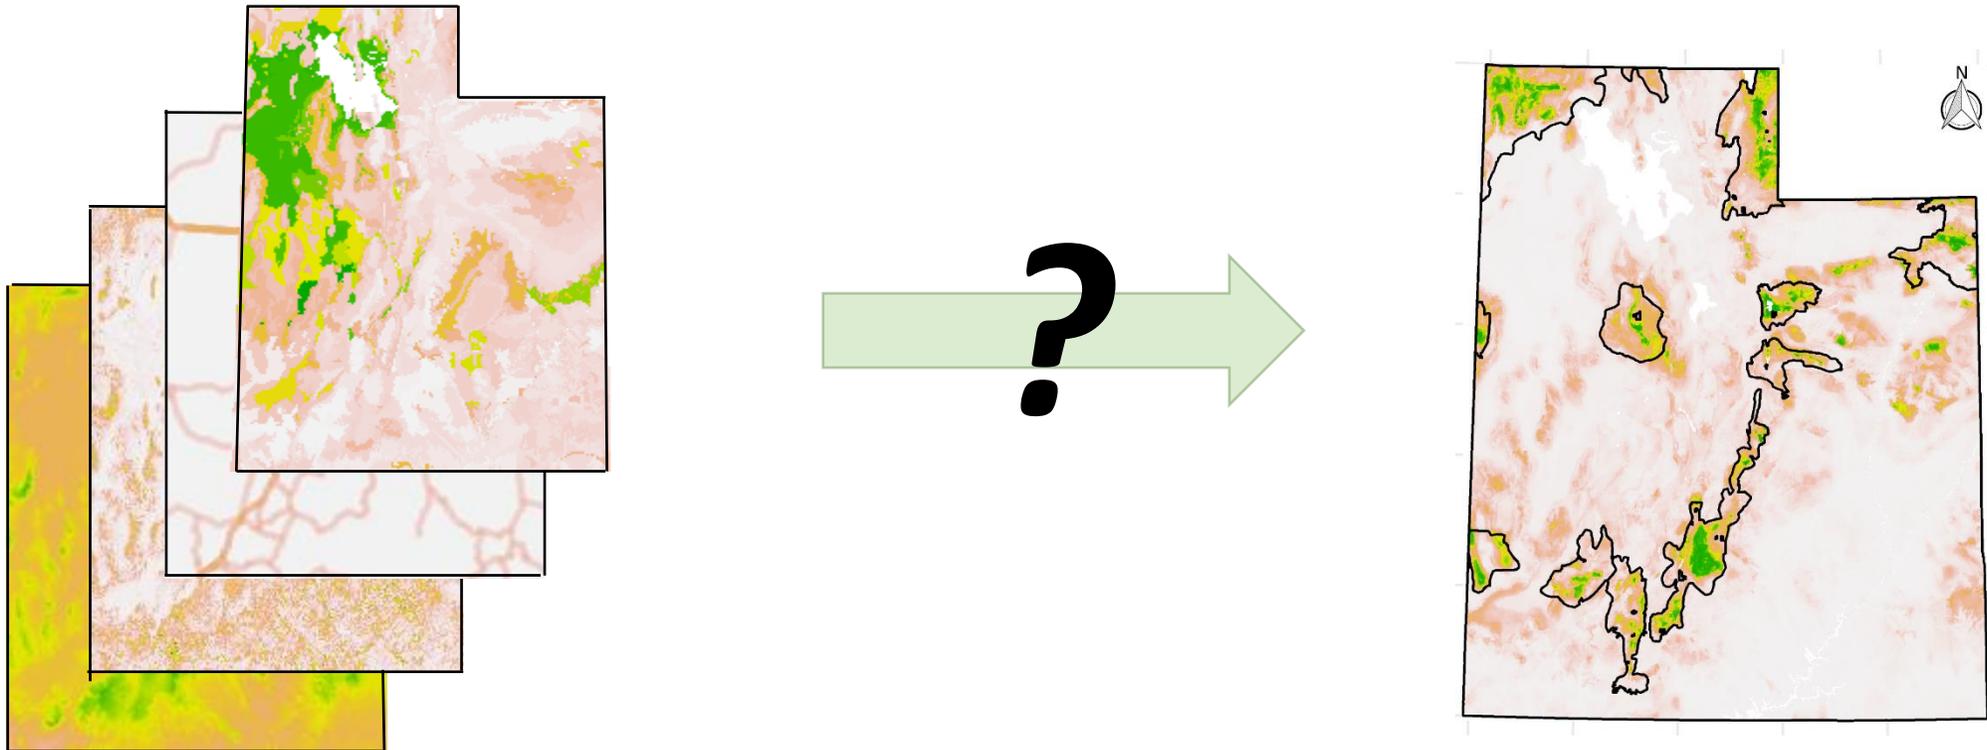

HABITAT MODEL

Training

Training data:

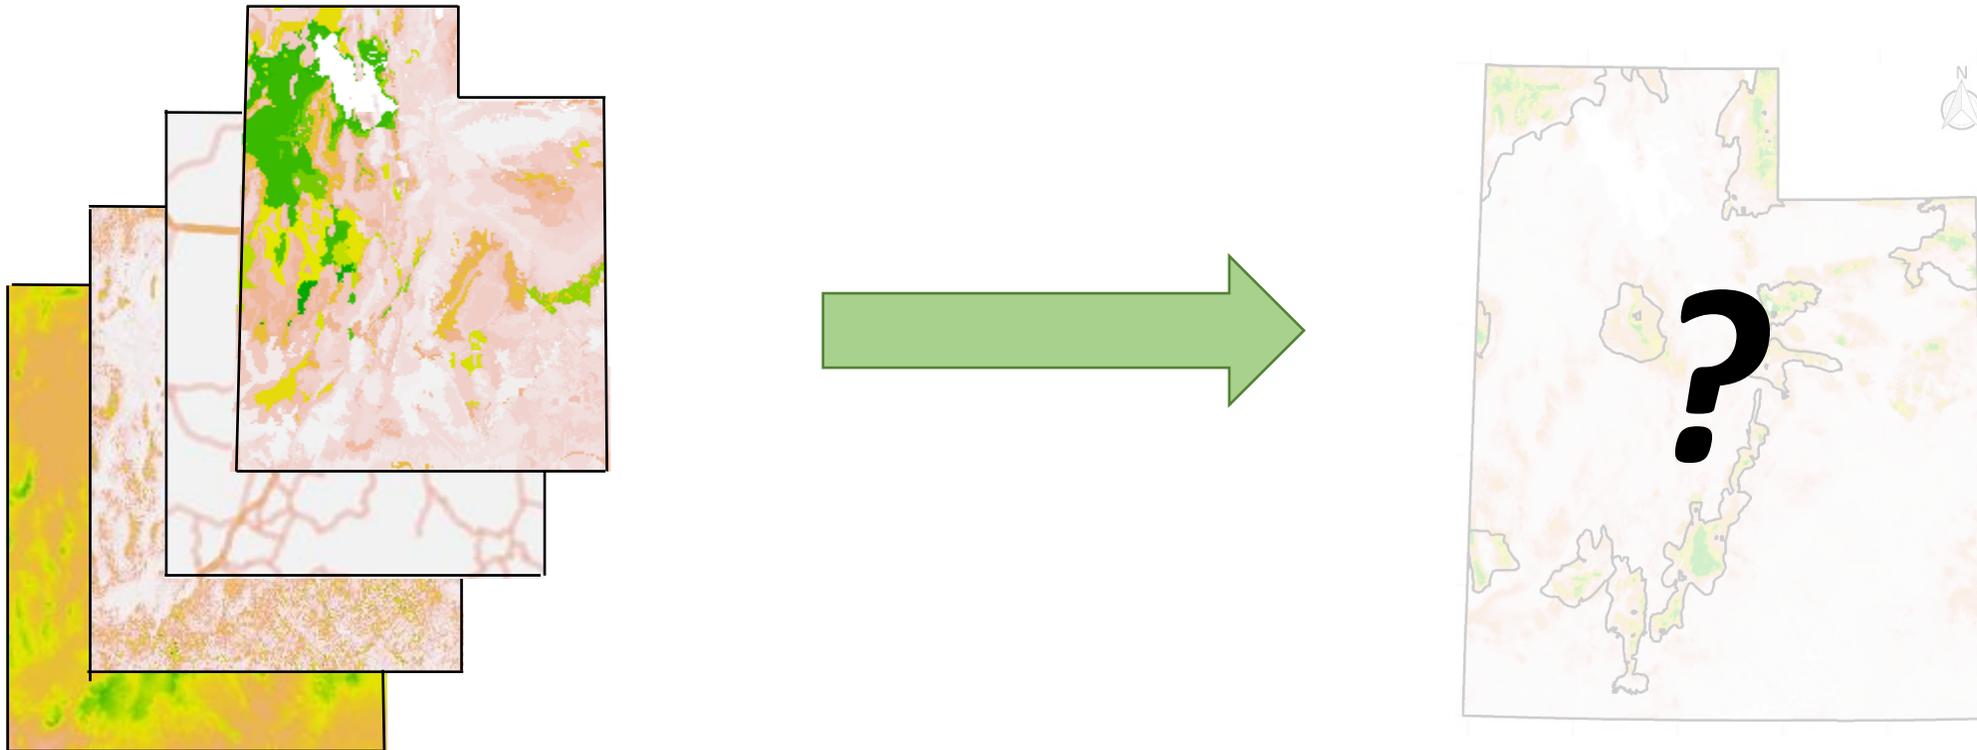

- Sage-grouse GPS tracking data state-wide (> 500,000 locations)
- Environmental predictors: shrub cover, tree cover, forb cover, elevation, slope, aspect, mesic habitat, distance to roads, transmission lines...
- Resource Selection Function (RSF) developed by Dr. Michel Kohl

HABITAT MODEL

Prediction

- Input data: output of the vegetation model for the candidate treatments
- Predicted vegetation composition 5 years after treatment
- Predict habitat selection using a RSF

PRIORITIZATION TOOL

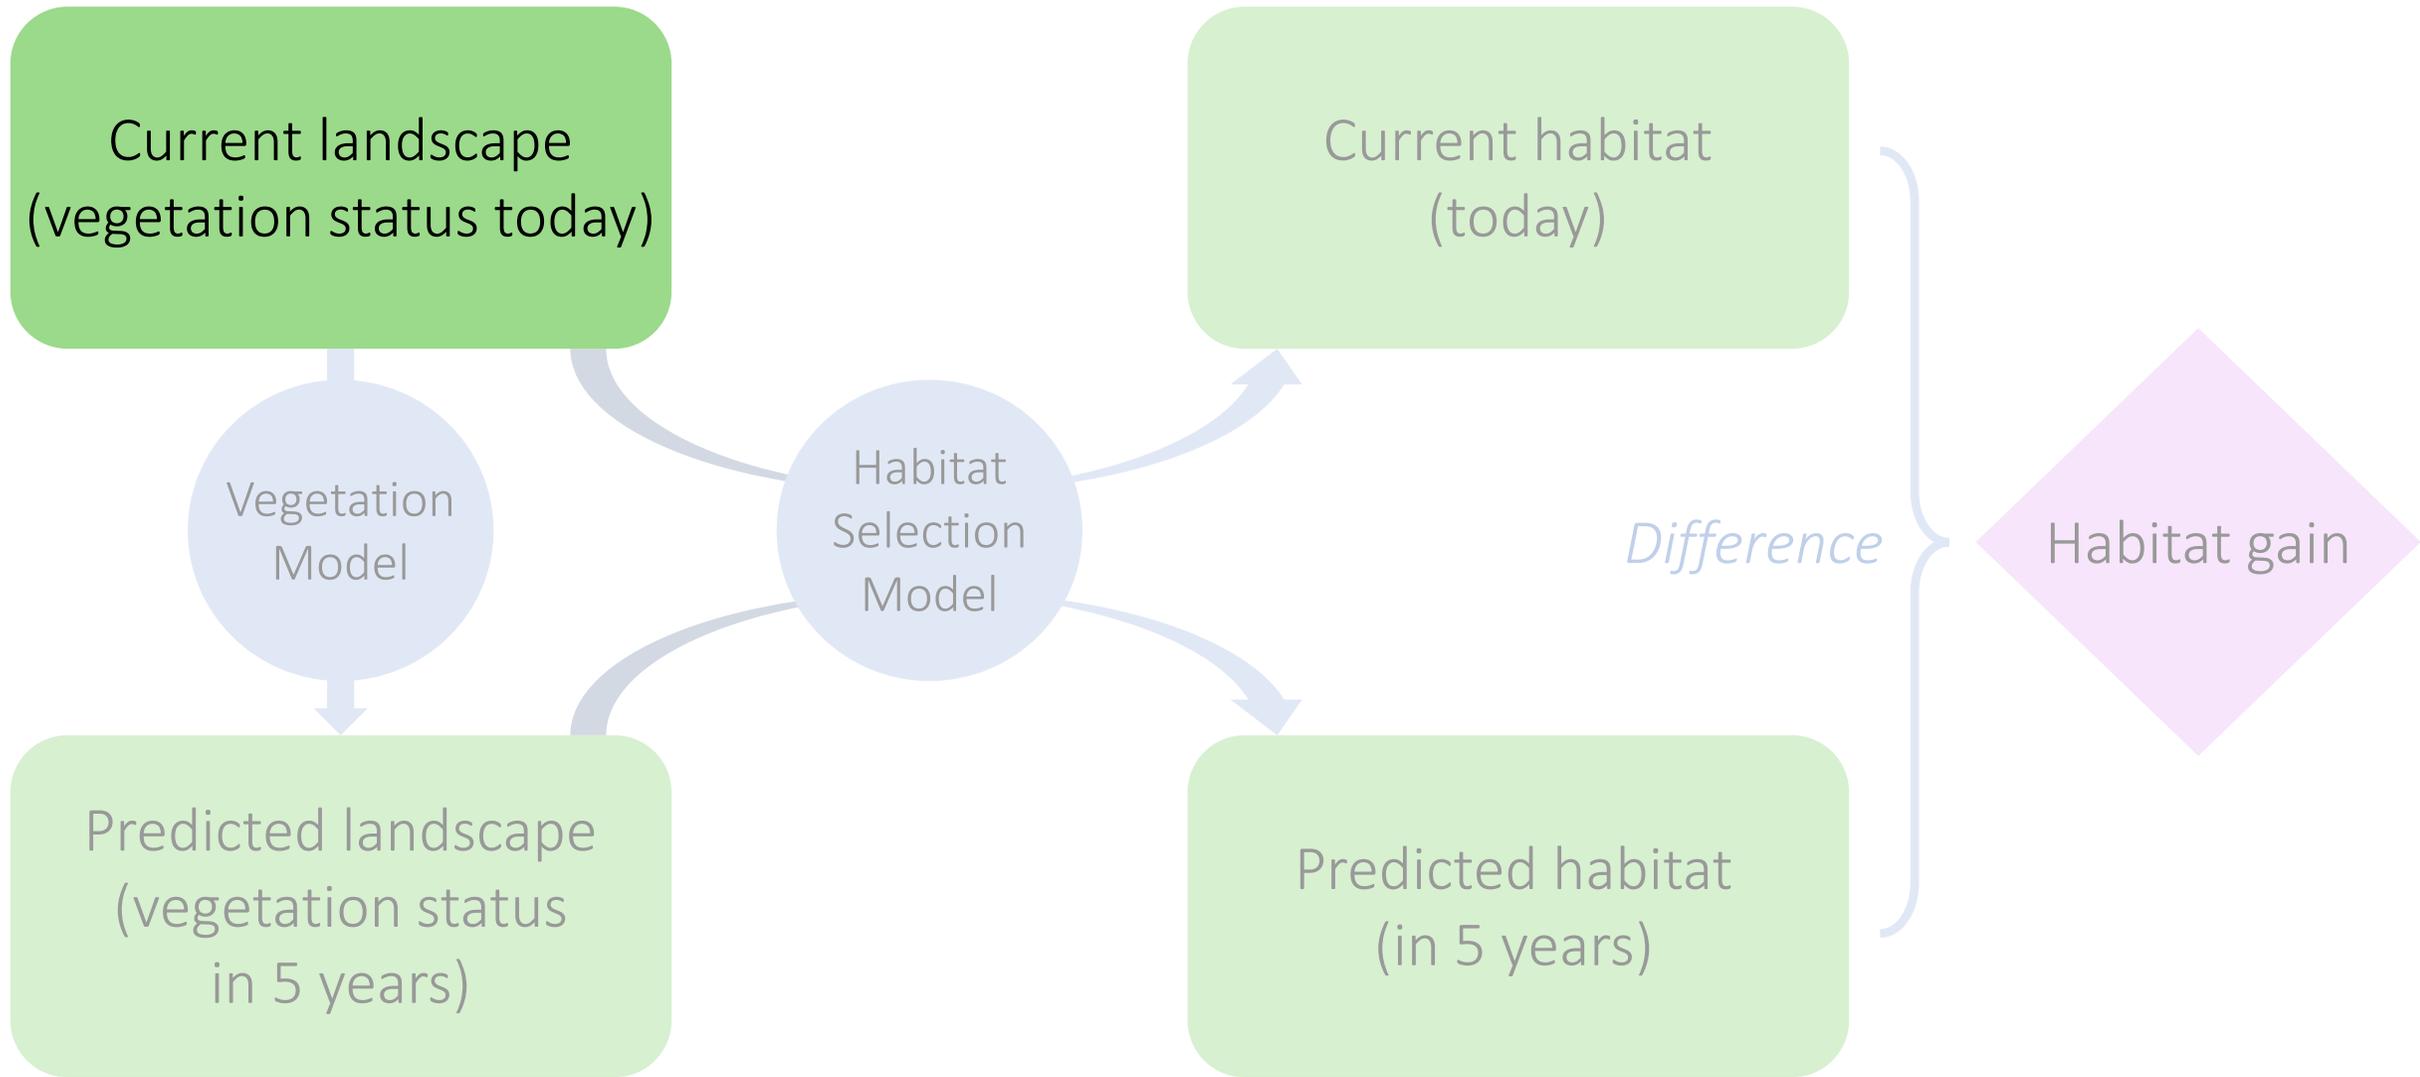

Demonstration

PRIORITIZATION TOOL

Demonstration

Let's pretend it's 2017, and we want to choose where to invest our money to do conifer treatments in 2018 in Box Elder County.

Step 1

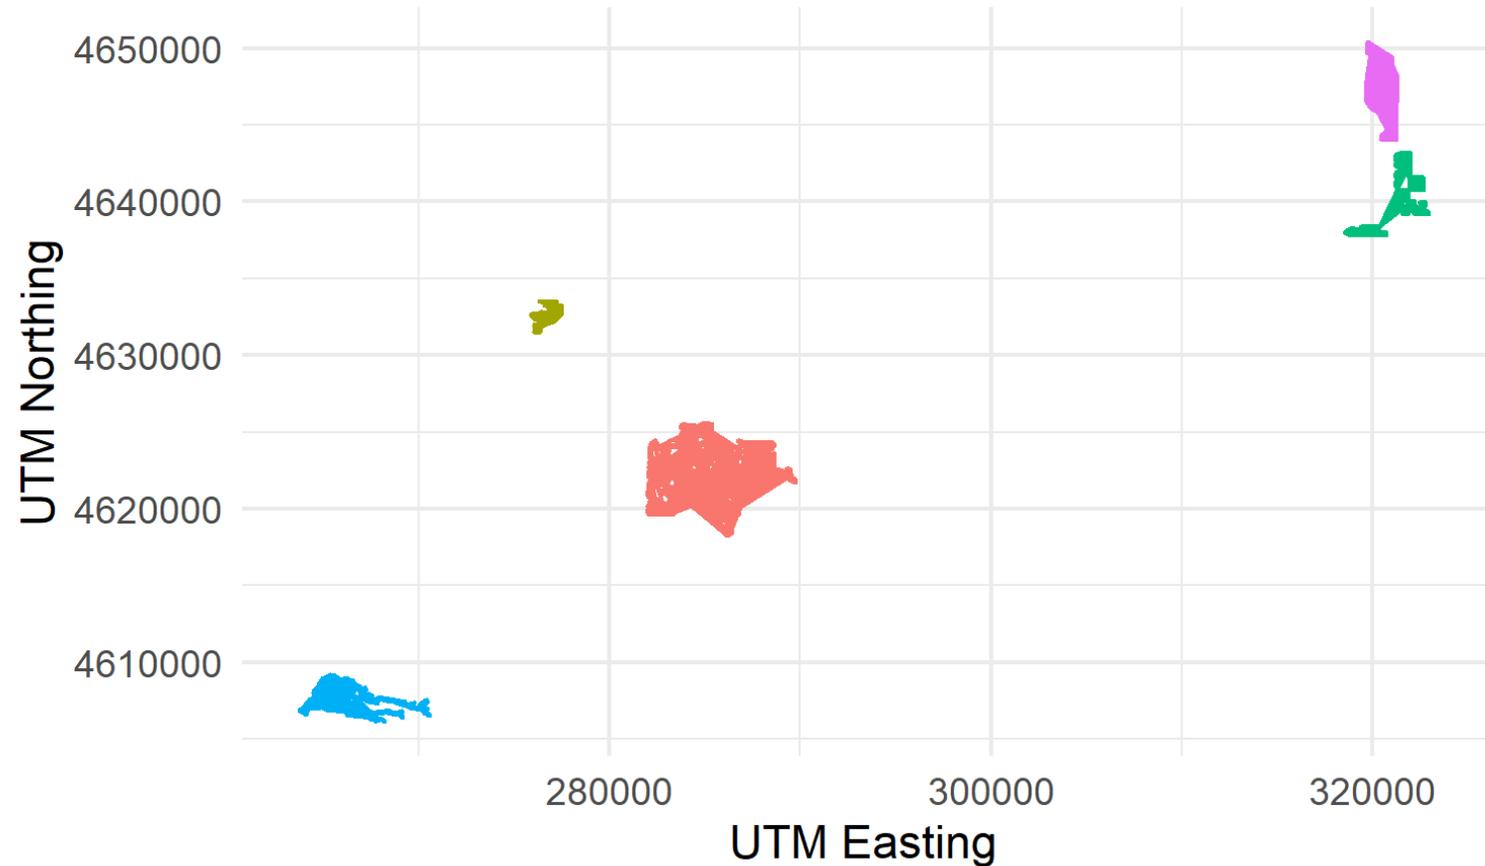

PRIORITIZATION TOOL

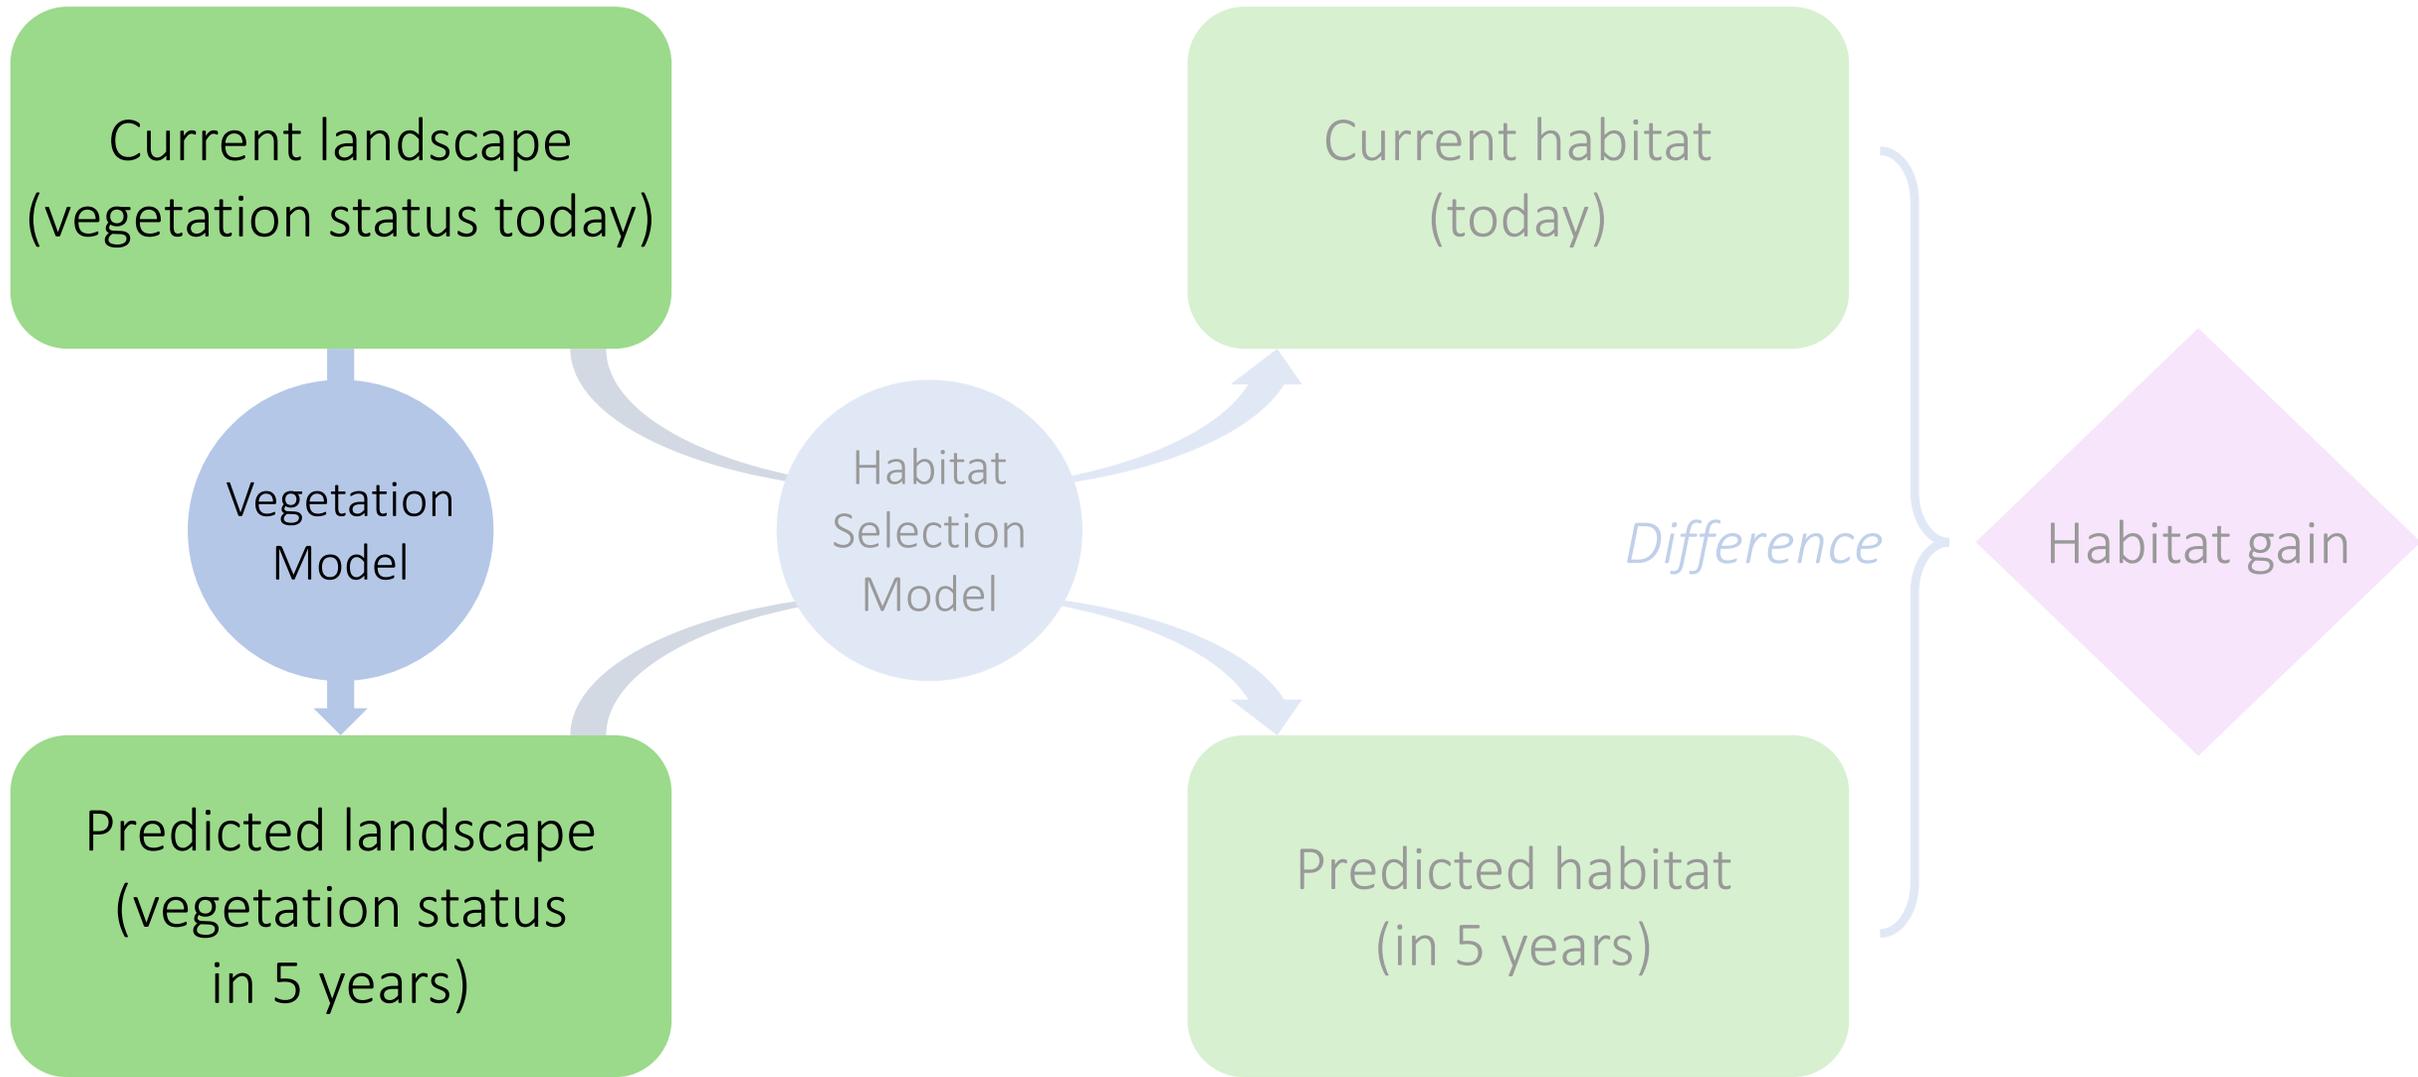

Demonstration

Step 1: Choose candidate treatments

- Keg Springs Bullhog
- Road Canyon
- Cedar Creek
- Crystal Hollow
- Warm Spring Hills

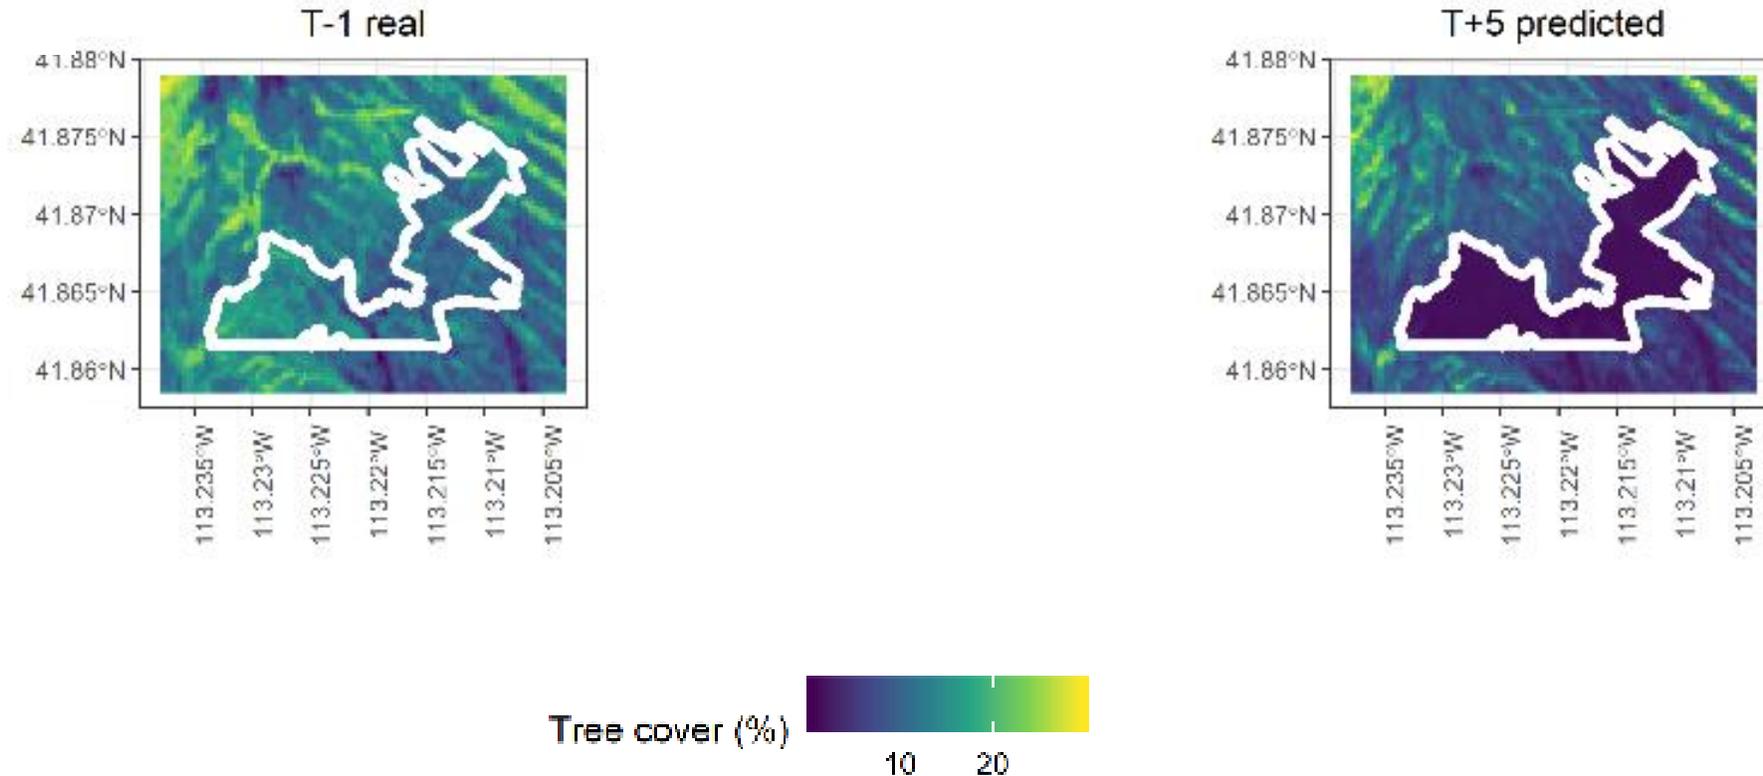

Step 2

PRIORITIZATION TOOL

Demonstration

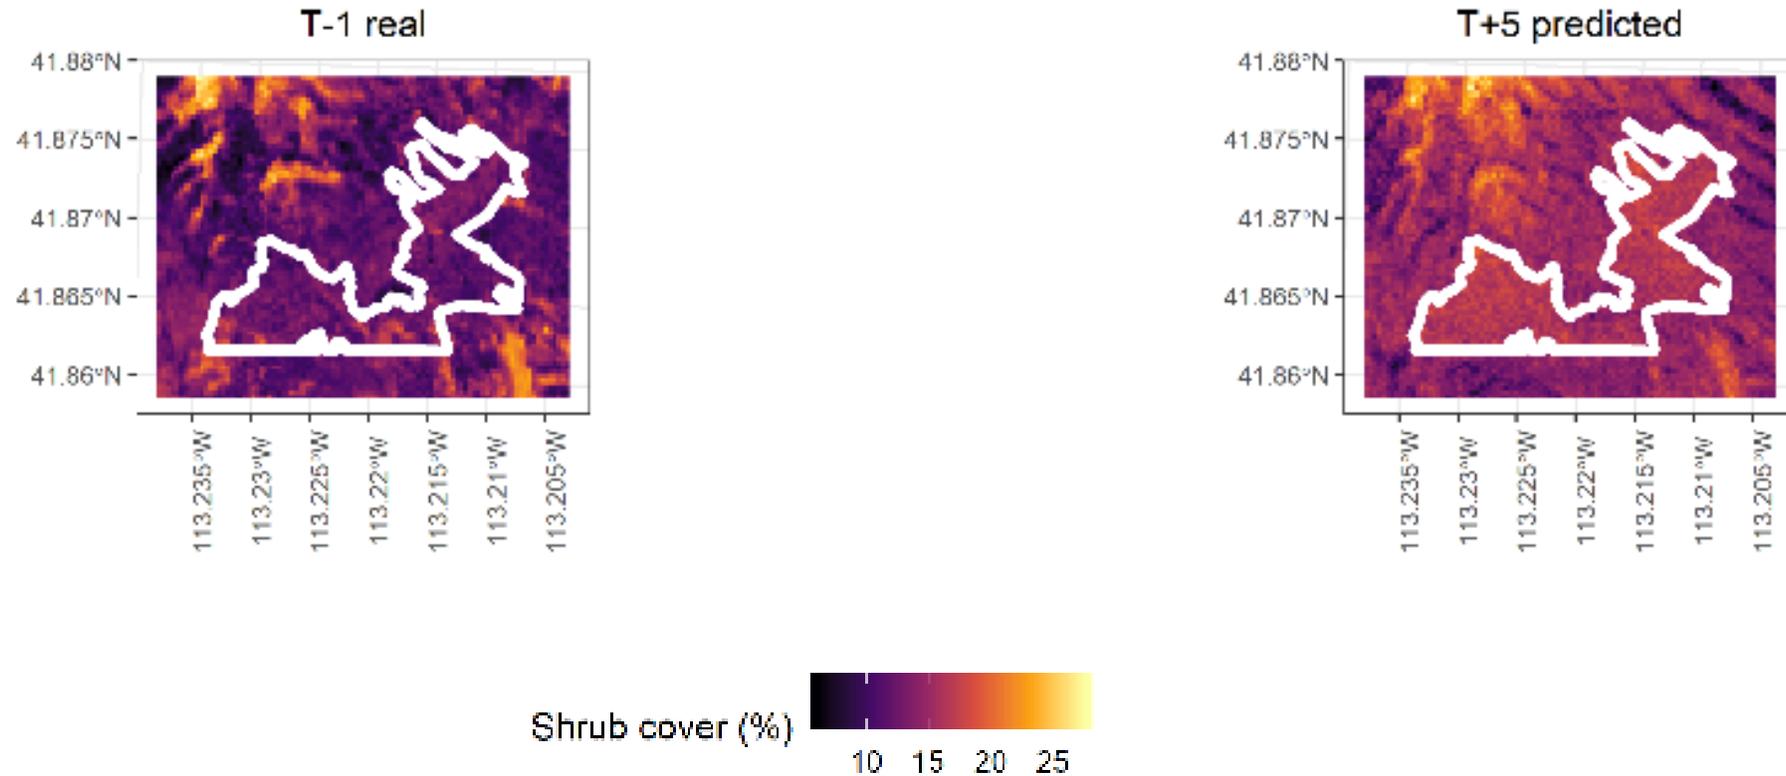

Step 2: Predict vegetation in 2023 based on current (2017)

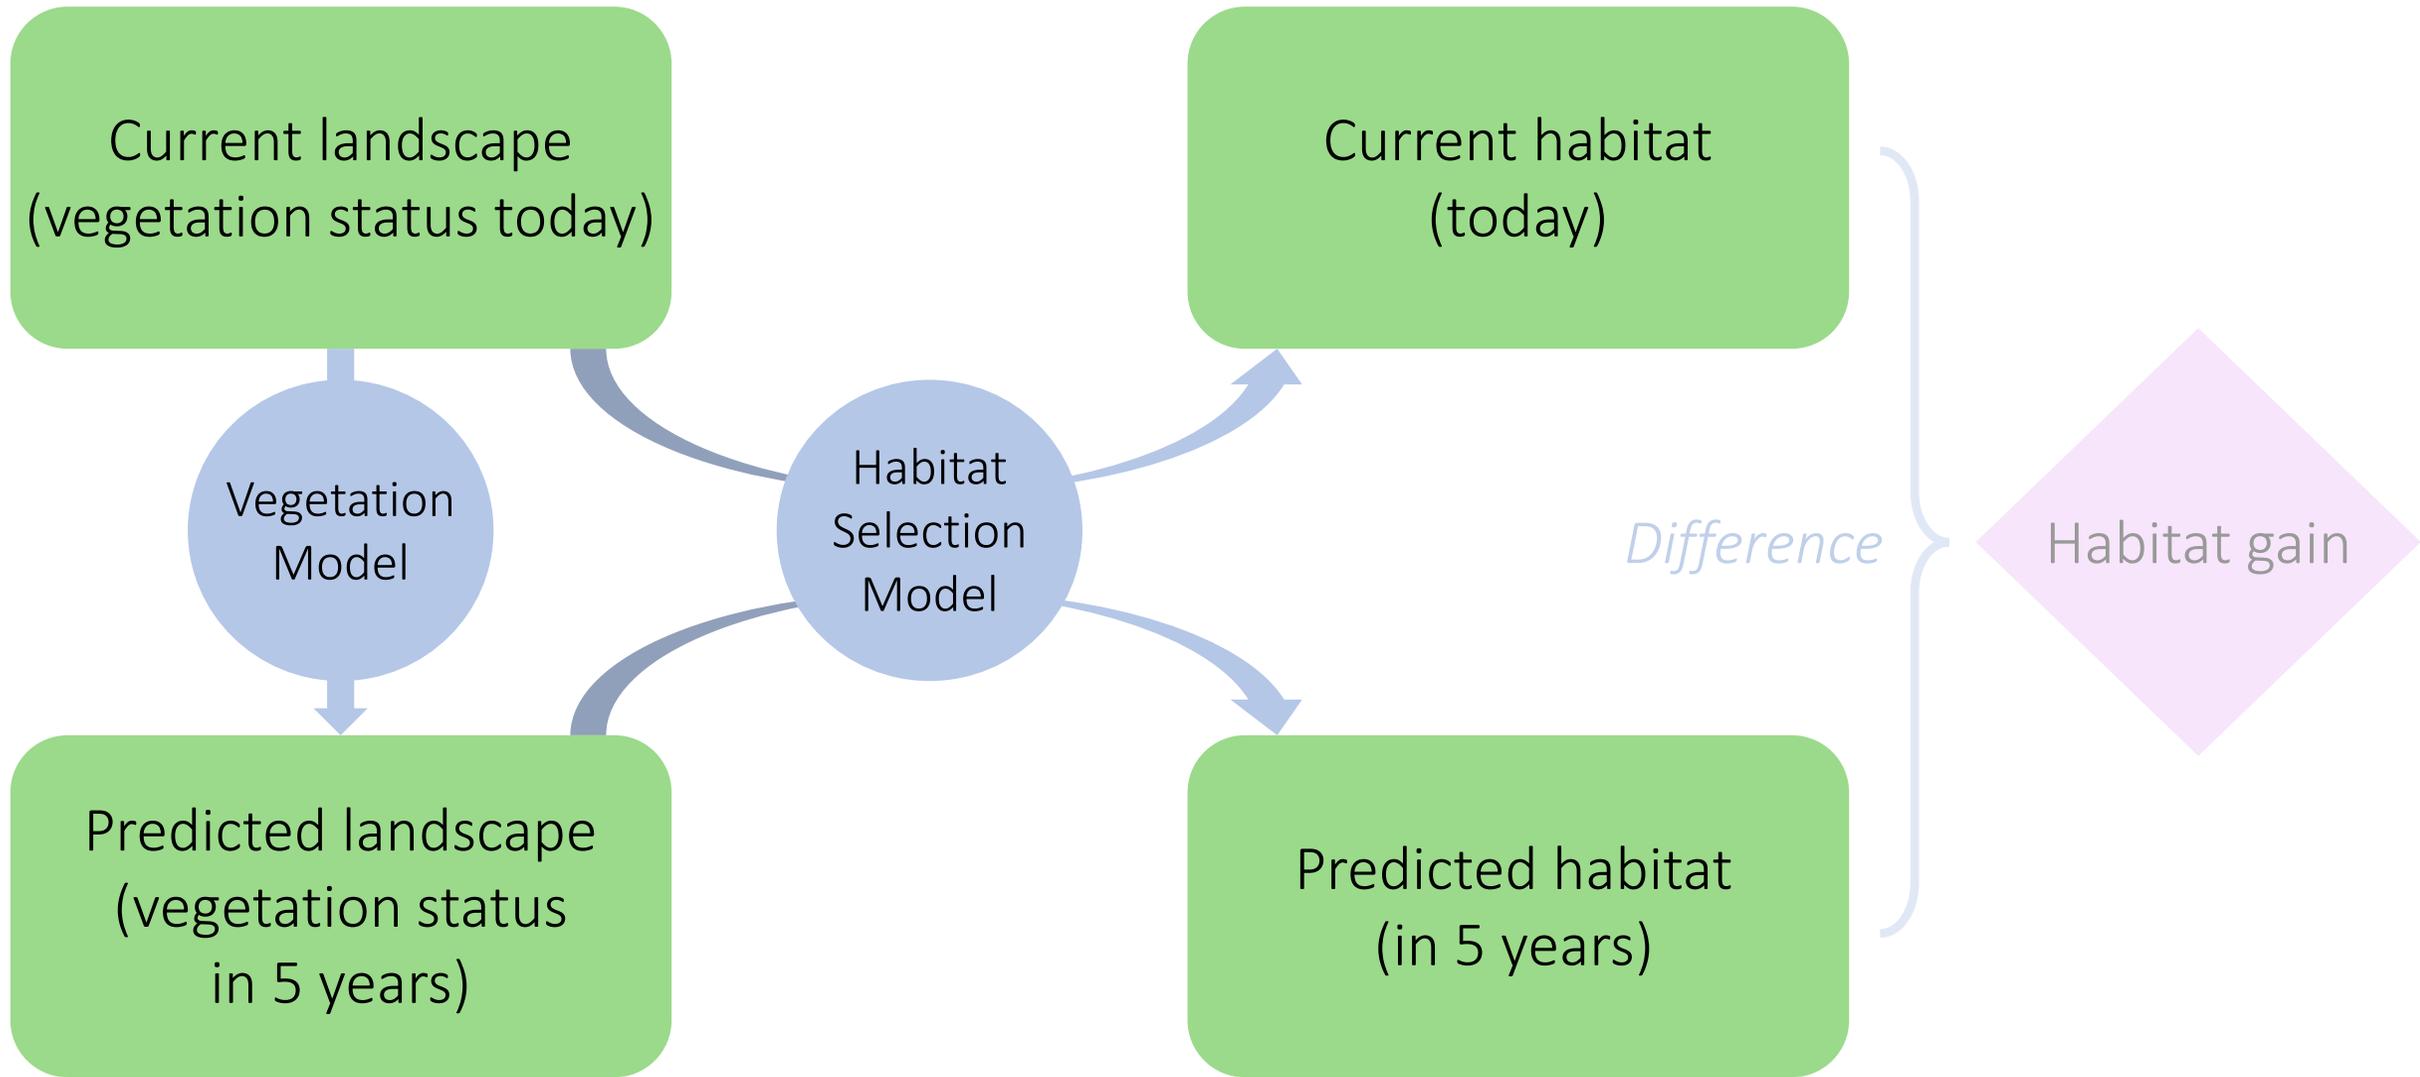

PRIORITIZATION TOOL

Demonstration

Step 2: Predict vegetation in 2023 based on current (2017)

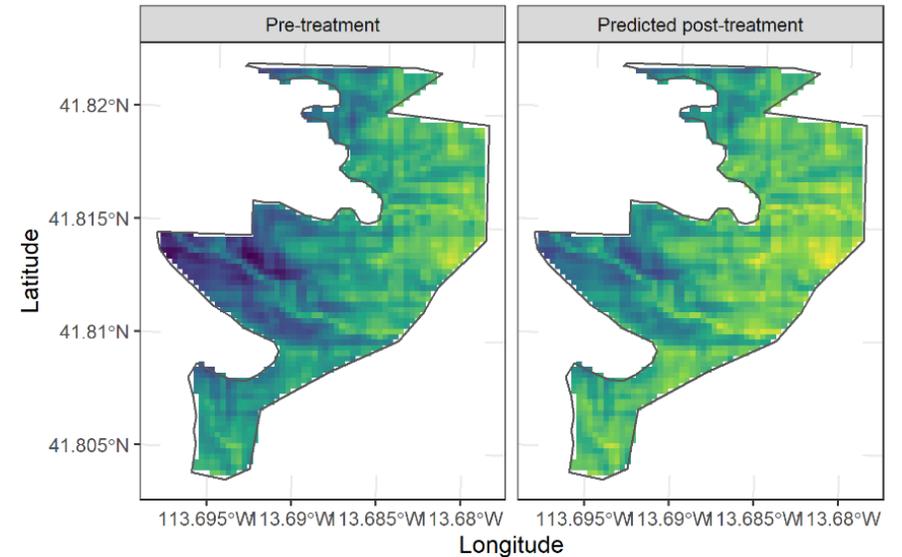

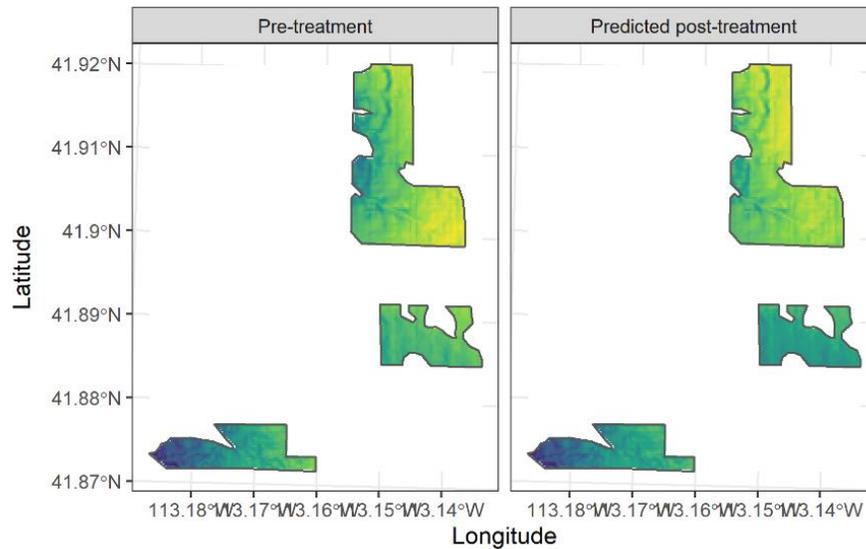

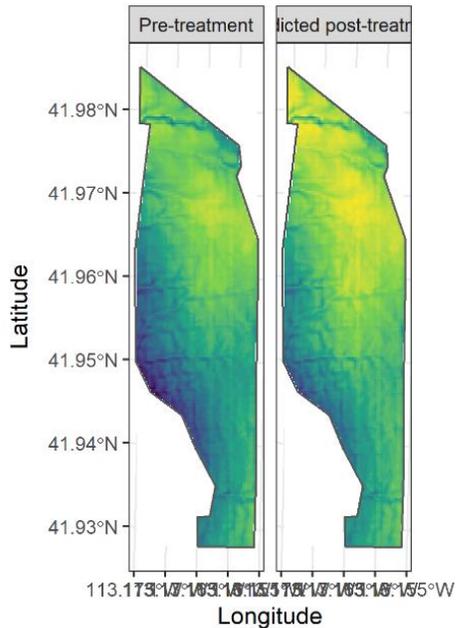

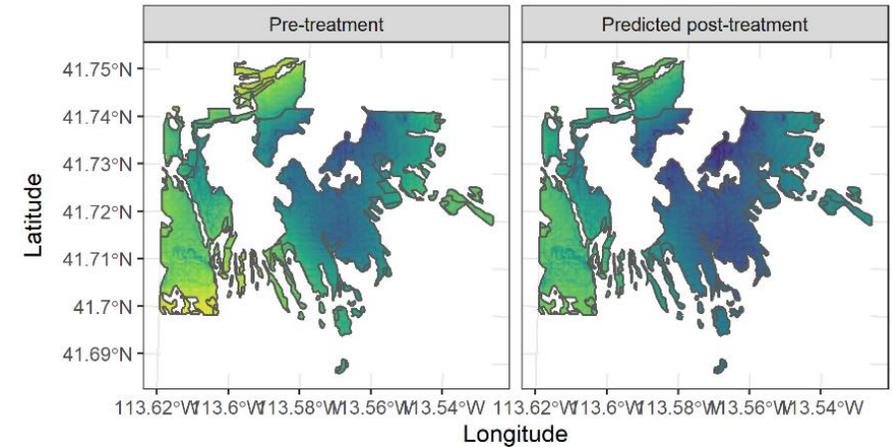

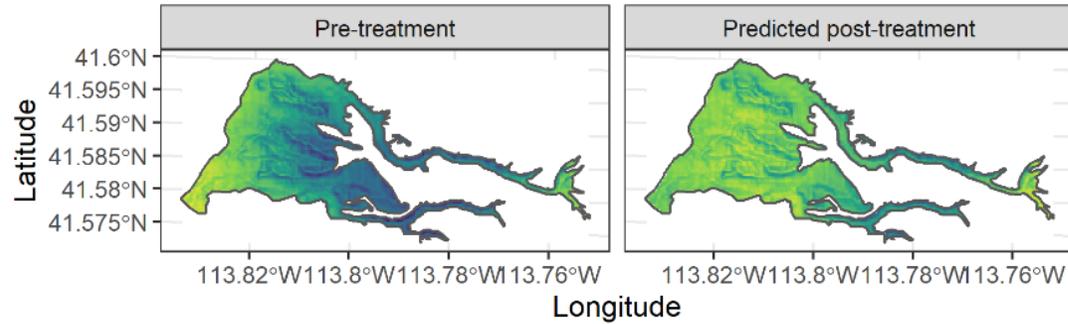

Step 3

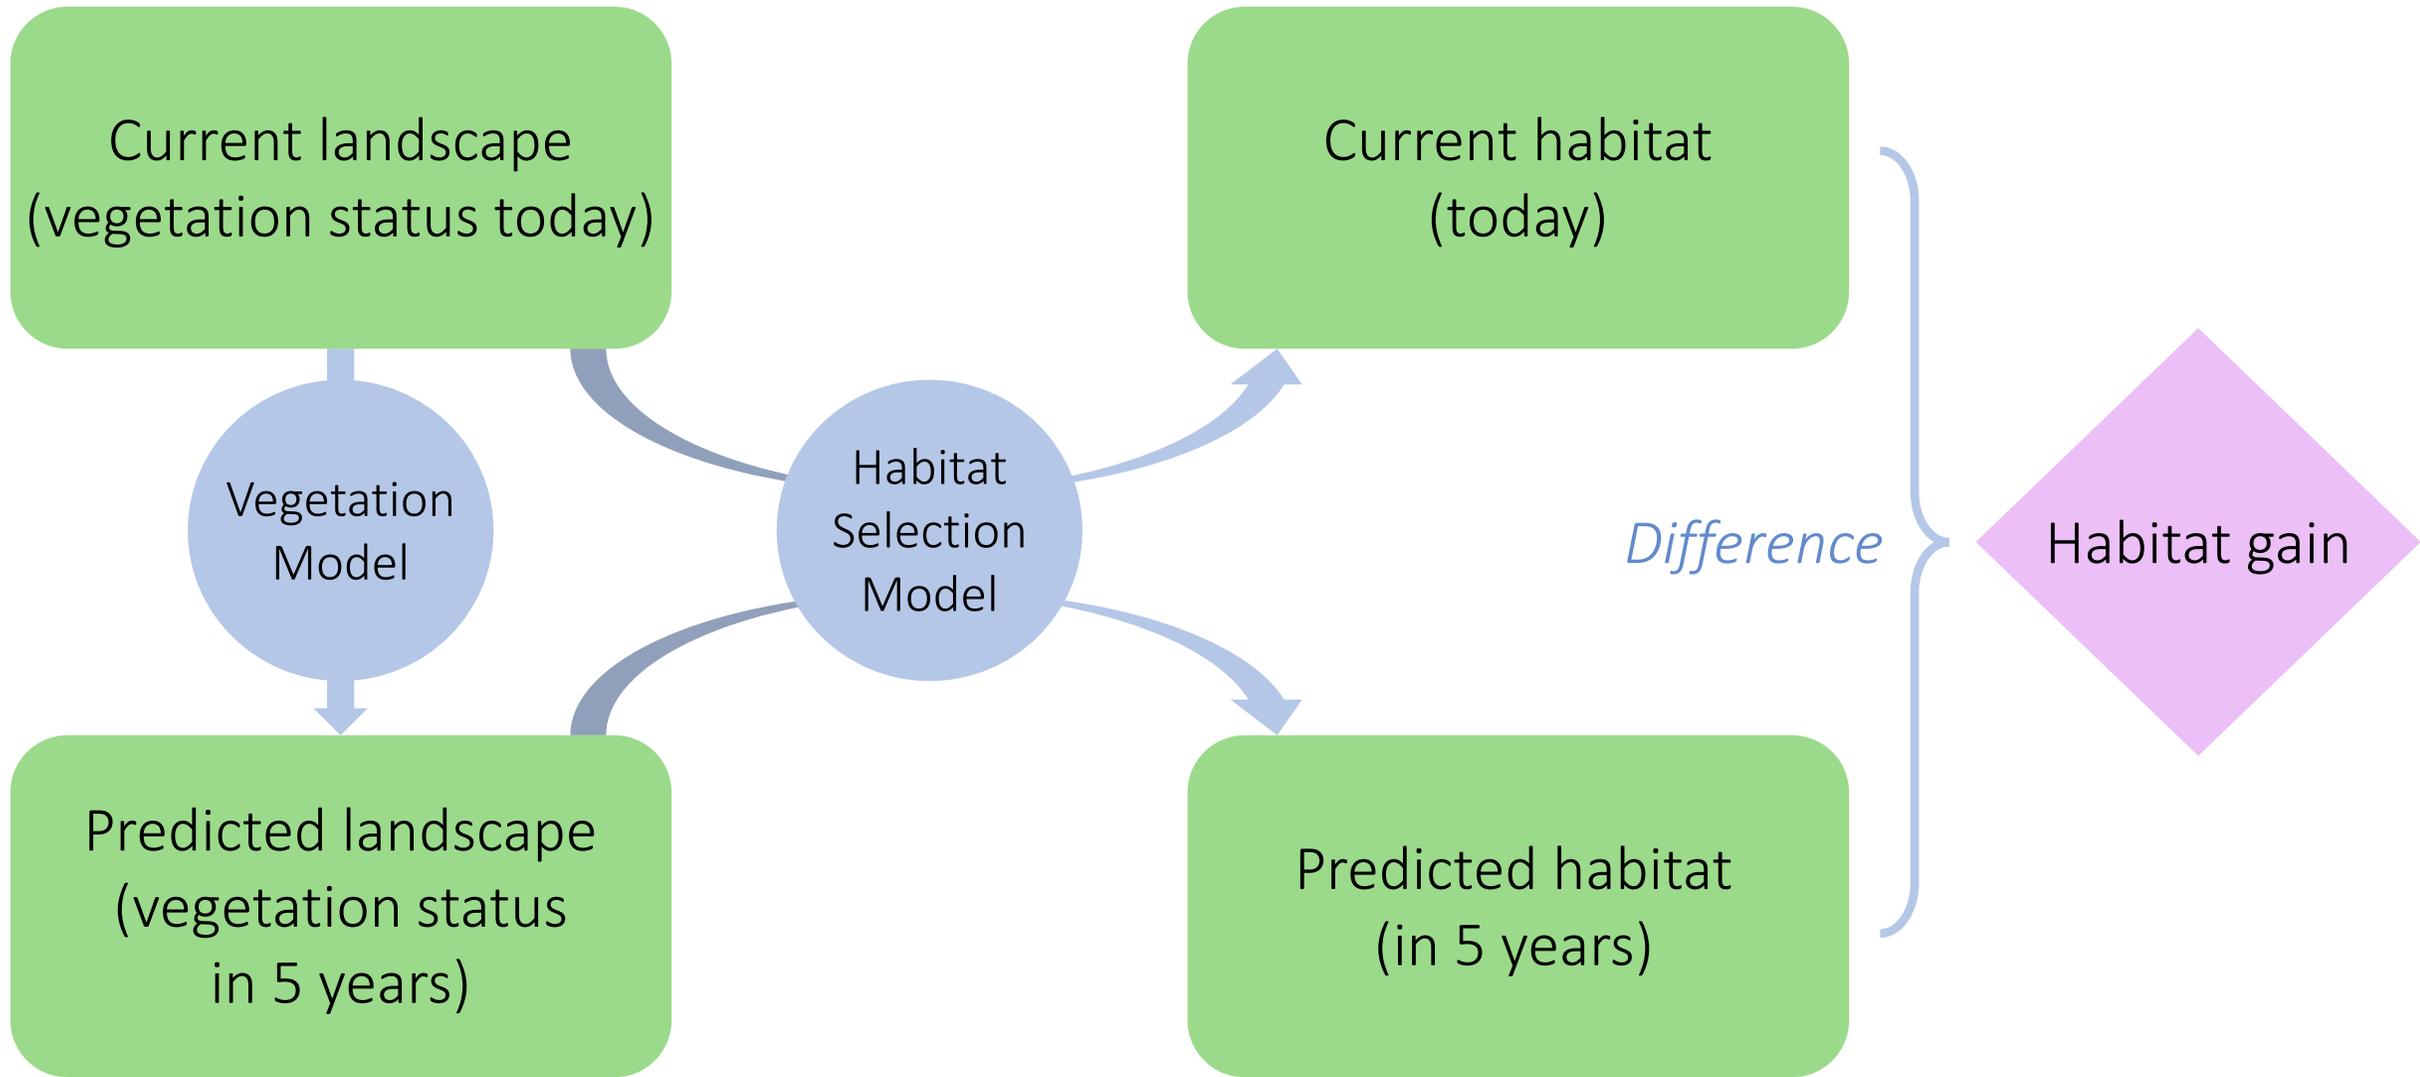

PRIORITIZATION TOOL

Demonstration

Step 3: Predict habitat in 2017 and 2023

Step 4

PRIORITIZATION TOOL

Demonstration

Step 4: Compare habitat gain as a result of treatment

- **Relative Selection Strength:** how much more likely sage-grouse will select for habitat the way it looks in 2023 compared to what it looked like in 2017 (sum across whole landscape)
- **Incorporate costs:** trade-off between habitat gained and money spent

PRIORITIZATION TOOL

Demonstration

Step 4: Compare habitat gain as a result of treatment

Treatment	Nesting habitat gain	Summer habitat gain	Total habitat gain	Total hab. gain per \$
Keg Springs Bullhog	5791.71	606.42	6398.14	0.20
Road Canyon	877.73	47.65	925.38	0.04
Cedar Creek	2679.23	-864.93	1814.30	0.01
Crystal Hollow	-28.07	-1370.97	-1399.04	-0.02
Warm Spring Hills	-8949.31	-15059.13	-24008.44	-0.02

PRIORITIZATION TOOL

Demonstration

Step 4: Compare habitat gain as a result of treatment

Treatment	Nesting habitat gain	Summer habitat gain	Total habitat gain	Total hab. gain per \$
Keg Springs Bullhog	5791.71	606.42	6398.14	0.20
Road Canyon	877.73	47.65	925.38	0.04
Cedar Creek	2679.23	-864.93	1814.30	0.01
Crystal Hollow	-28.07	-1370.97	-1399.04	-0.02
Warm Spring Hills	-8949.31	-15059.13	-24008.44	-0.02

PRIORITIZATION TOOL

Next Steps

PRIORITIZATION TOOL
